

Package ‘RAdamant’

July 12, 2011

Type Package

Title Financial Technical Analysis and Risk Management

Version 0.8.1

Date 2011-07-11

Author RAdamant Development Team

Maintainer RAdamant Development Team <team@r-adamant.org>

Depends R (>= 2.11.1), utils, grDevices

Description R-Adamant is a collection of functions and algorithms for processing of Financial Time Series, Risk Management and Econometrics.

License GPL>=2

LazyLoad yes

*3D Plot Elements***Description**

Add elements to 3D Plot

Usage

```

lines3d(x, y, z, pmat = getProjectionMatrix(), ...)
points3d(x, y, z, pmat = getProjectionMatrix(), ...)
rect3d(xrange, yrange, z, pmat = getProjectionMatrix(), ...)
text3d(x, y, z, pmat = getProjectionMatrix(), ...)

```

Arguments

x	X axis
y	Y axis
z	Z axis
pmat	pamt
...	Further arguments to or from other methods
xrange	xrange
yrange	yrange

Author(s)

RAdamant Development Team <team@r-adamant.org>

Description

Add and format labels for 3D Plot

Usage

```
x.axis3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2),
        zlim = getPlotLimits(3),
        pmat = getProjectionMatrix(), at = NULL,
        labels = NULL, theme.params = getCurrentTheme(),
        show.labels = TRUE, grid = theme.params[["xgrid"]],
        overrides = list(...), ...)
```

```
y.axis3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2), zlim =
        getPlotLimits(3),
        pmat = getProjectionMatrix(), at = NULL,
        labels = NULL, theme.params = getCurrentTheme(),
        show.labels = TRUE, grid = theme.params[["ygrid"]],
        overrides = list(...), ...)
```

```
z.axis3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2), zlim =
        getPlotLimits(3),
        pmat = getProjectionMatrix(), at = NULL, labels = NULL,
        theme.params = getCurrentTheme(), show.labels = TRUE,
        grid = theme.params[["zgrid"]],
        overrides = list(...), ...)
```

```
x.title3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2), zlim =
        getPlotLimits(3),
        pmat = getProjectionMatrix(), title = "",
        theme.params = getCurrentTheme(), ...)
```

```
y.title3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2), zlim =
        getPlotLimits(3),
        pmat = getProjectionMatrix(), title = "",
        theme.params = getCurrentTheme(), ...)
```

```
z.title3d(xlim = getPlotLimits(1), ylim = getPlotLimits(2), zlim =
        getPlotLimits(3),
        pmat = getProjectionMatrix(), title = "",
        theme.params = getCurrentTheme(), ...)
```

```
getPlotLimits(which = 1:3, env = getOption("RAdamant"))
```

```
setPlotLimits(xlim = NULL
, ylim = NULL
```

```
, zlim = NULL
, env = getOption("RAdamant")
)
```

Arguments

xlim	xlim
ylim	ylim
zlim	zlim
pmat	pmat
at	at
which	which
env	environment
labels	labels
title	title
theme.params	theme.params
show.labels	show.labels
grid	grid
overrides	Overrides list
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

abi

Absolute Breath Index - ABI

Description

Compute Absolute Breath Index (Technical Analysis)

Usage

```
Abi(X, lag = 5, plot=FALSE, ...)
```

Arguments

X	Input numerical series
lag	Number of lags
plot	LOGICAL. Return plot.
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

absrs	<i>Absolute Relative Strenght</i>
-------	-----------------------------------

Description

Compute Absolute Relative Strenght (Technical Analysis)

Usage

```
absrs(X, lag = 14, na.rm = FALSE, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
na.rm	na.rm
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

acdi	<i>Acceleration Deceleration</i>
------	----------------------------------

Description

Acceleration Deceleration Technical Indicator

Usage

```
acdi(Close, High = NULL, Low = NULL, Vol = NULL, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Vol	VECTOR. Asset traded Volume.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

adi	<i>Advance-Dcline Indicator</i>
-----	---------------------------------

Description

Advance-Dcline Indicator (Technical Analysis)

Usage

```
ADind(close, high, low, lag = 5)
```

Arguments

close	VECTOR. Close price.
high	VECTOR. high price.
low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

adrating	<i>Average Directional Rating</i>
----------	-----------------------------------

Description

Compute Average Directional Rating index (Technical Analysis)

Usage

```
ADrating(close, high, low, lag)
```

Arguments

close	VECTOR. Close price.
high	VECTOR. high price.
low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

adratio

Advance Decline ratio

Description

Compute Advance Decline ratio (Technical Analysis)

Usage

```
ADratio(X, lag, plot, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

advdec

Advance Decline issues

Description

Compute Advance Decline issues (Technical Analysis)

Usage

```
AdvDec(X, lag = 5, ret.idx = TRUE, plot = FALSE, ...)
```

Arguments

<code>X</code>	<code>X</code>
<code>lag</code>	INTEGER. Number of lag periods.
<code>ret.idx</code>	<code>ret.idx</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

ama

General Adaptive Moving Average

Description

General Adaptive Moving Average, computed on each column of the input data `X`.

Usage

```
ama(X, ar.ord = 1, ma.ord = 1, func = NULL, padding = 0, type = "AMA",
    plot = FALSE, ...)
```

Arguments

<code>X</code>	<code>X</code>
<code>ar.ord</code>	<code>ar.ord</code>
<code>ma.ord</code>	<code>ma.ord</code>
<code>func</code>	<code>func</code>
<code>padding</code>	<code>padding</code>
<code>type</code>	<code>type</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

apo	<i>Apo - Absolute price indicator</i>
-----	---------------------------------------

Description

Apo - Absolute price indicator

Usage

```
apo(X, fast.lag = 10, slow.lag = 30, plot = FALSE, ...)
```

Arguments

X	X
fast.lag	fast.lag
slow.lag	slow.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

apprais	<i>Appraisal ratio</i>
---------	------------------------

Description

Appraisal: Calculate Jensen index for a portfolio
 Appraisal.Capm: Get Jensen index from an object of class "Capm".

Usage

```
Appraisal(PTF, ...)
## Default S3 method:
Appraisal(PTF, PTF_M, rf = NULL, rfr = 0, ...)
## S3 method for class 'Capm'
Appraisal(PTF, rfr = 0, ...)
```

Arguments

PTF	Input portfolio or an object of class "Capm"
PTF_M	Market/benchmark portfolio
rfr	risk free rate
rf	risk free asset
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[Sharpe, Treynor, Jensen](#)

archlm	<i>ARCH-LM test</i>
--------	---------------------

Description

Compute ARCH-LM test

Usage

```
Archlm(x, lags, std=FALSE, plot.acf=FALSE)
```

Arguments

x	x
lags	lags
std	std
plot.acf	plot.acf

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

armaspc	<i>Arma spectral representation</i>
---------	-------------------------------------

Description

Spectral representation based on ARMA models

Usage

```
Arma.Spec(X, ar_ord = 1, ma_ord = 1, vfreq = NULL)
```

Arguments

X	X
ar_ord	ar_ord
ma_ord	ma_ord
vfreq	vfreq

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

arms	<i>Arms index</i>
------	-------------------

Description

Compute Arms index (Technical Analysis)

Usage

```
Arms(X, Volume, lag, plot = FALSE, ...)
```

Arguments

X	X
Volume	VECTOR. Asset traded Volume.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

arodown	<i>Aroon Down oscillator</i>
---------	------------------------------

Description

Compute Aroon Down oscillator (Technical Analysis)

Usage

```
arodown(X, lag = 5, plot = TRUE, ...)
```

Arguments

<code>x</code>	<code>X</code>
<code>lag</code>	INTEGER. Number of lag periods.
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

aroon

Aroon oscillator

Description

Compute Aroon oscillator (Technical Analysis)

Usage

```
aroon(X, lag = 5, plot = TRUE, ...)
```

Arguments

<code>x</code>	<code>X</code>
<code>lag</code>	INTEGER. Number of lag periods.
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

aroud	<i>Aroon Down oscillator</i>
-------	------------------------------

Description

Compute Aroon Down oscillator (Technical Analysis)

Usage

```
aroud(X, lag = 5, plot = TRUE, ...)
```

Arguments

X	X
lag	lag
plot	plot
...	...

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

aroup	<i>Aroon Up oscillator</i>
-------	----------------------------

Description

Compute Aroon Up oscillator (Technical Analysis)

Usage

```
aroup(X, lag = 5, plot = TRUE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

asfs

Convert Yahoo! Data into Financial Series object

Description

Converts a stock data series (dataframe) into a Financial Series (fs) object.

Usage

```
as.fs(X, SName = "", Symbol = "")
```

Arguments

X	Input dataframe with columns (Open, High, Low, Close, Volume, Adj.Close).
SName	The name assigned to the fs object.
Symbol	The symbol assigned to the fs object.

Value

A financial Time Series object. This is a matrix with columns (Open, High, Low, Close, Volume, Adj.Close). The following attributes are attached to the object:

SName	The Name/Description of the financial series.
Symbol	The input stock symbol.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Load sample financial series data
data(ex_fs)
# Subset data and create another fs object
as.fs(as.data.frame(ex_fs[1:10,]), SName = "My Financial Series", "My Symbol")
```

assmeas

Association measures

Description

Measures of Association of Predicted Probabilities and Observed Responses

Usage

```
KendallTau(target, pred, ...)
GKgamma(target, pred, ...)
CalcPairs(target, pred, segm_fact = 0.002)
SomerD(target, pred, ...)

confusionM(target, ...)
## Default S3 method:
confusionM(target, pred, th=0.5, ...)
## S3 method for class 'scorecard'
confusionM(target, th=0.5, ...)
accuracy(x, ...)
## S3 method for class 'scorecard'
accuracy(x, th=0.5, ...)
```

Arguments

target	VECTOR. Observed target value
pred	VECTOR. Predicted values
x	An object of class "scorecard"
segm_fact	Segmentation factor used for pairs calculation
th	Threshold value for the predicted values (Defaults = 0.5)
...	Further arguments to or from other methods

Details

- **KendallTau**: calculate Kendall rank correlation coefficient;
- **GKgamma**: calculate Goodman and Kruskal's gamma;
- **SomerD**: calculate Somer D statistic;
- **CalcPairs**: calculate number of *Concordant* and *Discordant* pairs;
- **confusionM**: calculate confusion matrix predicted VS original values
- **accuracy**: get accuracy measure from the results of a classification model

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example data set
data(ex_credit)

## Generate Score Card
data = ex_credit[, -1]
target = ex_credit[, 1]
# Example of scorecard
sc3 = Score.card(X=data, Y=target, nseg = c(2,3,4))
sc3

# get confusion matrix for an object of class "scorecard"
```

```

confusionM(sc3, 0.5)
# extract accuracy measures
accuracy(sc3, 0.4)

# get predicted values
pred = predict(sc3)

# calculate association measures
SomerD(target, pred)
KendallTau(target, pred)
GKgamma(target, pred)

```

barthann

Bartlet-Hann window

Description

Computes Bartlet-Hann window of given length

Usage

```
barthann(N, normalized = TRUE, alpha = 0.38)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.
alpha	Shape factor (DEFAULT = 0.38).

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Bartlet-Hann window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```

# Generate a Bartlet-Hann window of size 100
x = barthann(100, FALSE)
# Plot the window
cplot(x
, main = "Bartlet-Hann Window"
, legend = attr(x, "type")
)

# Generate another window with different smoothing factor
y = barthann(100, normalized = FALSE, alpha = 0.5)
# Compare the two windows
cplot(cbind(x, y)
, main = "Bartlet-Hann Window"
, legend = paste("Bartlet-Hann (alpha = ", c(0.38, 0.5), ")", sep = " ")
)

```

```
, type = c("l", "o")
, xlab.srt = 0
)
```

bartlet

Bartlet window

Description

Computes Bartlet window of given length

Usage

```
bartlet(N, normalized = TRUE)
```

Arguments

N Window length.

normalized LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Bartlet window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Bartlet window of size 100
x = bartlet(100)
# Plot the window
cplot(x
, main = "Bartlet Window"
, legend = attr(x, "type")
)
# Generate a non-normalised window
y = bartlet(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Bartlet Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)
```

bincoef	<i>Binomial coefficient</i>
---------	-----------------------------

Description

Calculate binomial coefficient

Usage

```
BinCoef(N, n)
```

Arguments

N	N
n	n

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

blackman	<i>Blackman window</i>
----------	------------------------

Description

Computes Blackman window of given length

Usage

```
blackman(N, normalized = TRUE, alpha = 0.16)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.
alpha	Shape factor (DEFAULT = 0.16). Determines the smoothing of the window sidelobes.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Blackman window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Blackman window of size 100
x = blackman(100, FALSE)
# Plot the window
cplot(x
, main = "Blackman Window"
, legend = attr(x, "type")
)

# Generate another window with lower smoothing factor
y = blackman(100, normalized = FALSE, alpha = 0.4)
# Compare the two windows
cplot(cbind(x, y)
, main = "Blackman Window"
, legend = paste("Blackman (alpha = ", c(0.16, 0.4), ") ", sep = " ")
, type = c("l", "o")
, xlab.srt = 0
)
```

bolband

*Bollinger Bands***Description**

Compute Bollinger Bands (Technical Analysis)

Usage

```
BolBand(Close, High, Low, fact = 2, win.size = 5, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
fact	fact
win.size	win.size
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bolbandb

Bollinger Bands Bandwidth

Description

Compute Bollinger Bands Bandwidth (Technical analysis)

Usage

```
BolBandB(Close, High, Low, fact=2, win.size=5, plot=FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
fact	fact
win.size	win.size
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bolfib

Bollinger Bands - Fibonacci ratio

Description

Compute Bollinger Bands - Fibonacci ratio (Technical Analysis)

Usage

```
Bol.Fib(Close, High, Low, win.size = 5, fibo = c(1.618, 2.618, 4.236),
plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
win.size	win.size
fibo	fibo
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

boot	<i>General bootstrapping function</i>
------	---------------------------------------

Description

General bootstrapping function

Usage

```
boot(X, nboots = 100, func = NULL, init = NULL,  
     message = "Bootstrapping...", ...)
```

Arguments

X	X
nboots	nboots
func	func
init	init
message	message
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bop	<i>Balance of Power</i>
-----	-------------------------

Description

Compute Balance of Power (Technical Analysis)

Usage

```
Bop(Close, Open, High, Low, smoothed = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
Open	VECTOR. Open price.
High	VECTOR. High price.
Low	VECTOR. Low price.
smoothed	smoothed
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

box3d	<i>3D box</i>
-------	---------------

Description

Plotting tools

Usage

```
box3d(x, y, z, pmat = getProjectionMatrix(), half = FALSE, ...)
```

Arguments

x	X axis
y	Y axis
z	Z axis
pmat	pamt
half	half
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bpdLind	<i>BPDL indicator</i>
---------	-----------------------

Description

Compute BPDL indicator (Technical Analysis)

Usage

```
BPDLind(Close, lag = 1, smoothed = TRUE, slag = 5)
```

Arguments

Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
smoothed	smoothed
slag	slag

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

breadth	<i>Breadth trusth indicator</i>
---------	---------------------------------

Description

Compute Breadth trusth indicator (Technical Analysis)

Usage

```
Breadth(X, lag = 5, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bromot	<i>Brownian motion</i>
--------	------------------------

Description

Simulate a standard Brownian motion

Usage

```
BroMot(nsim, T, S0 = 0, mi = 0, sigma = 1,  
geom = TRUE, same.rnd = TRUE, plot = FALSE, ...)
```

Arguments

nsim	nsim
T	T
S0	S0
mi	mi
sigma	sigma
geom	geom
same.rnd	same.rnd
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bromot2d	<i>2-dimensional Brownian motion</i>
----------	--------------------------------------

Description

Simulate a bi-dimensional standard Brownian motion

Usage

```
BroMot2D(nsim, T, S0, mi, sigma, geom = TRUE,
  same.rnd = FALSE, laydisp = NULL, plot = TRUE, ...)
```

Arguments

nsim	nsim
T	T
S0	S0
mi	mi
sigma	sigma
geom	geom
same.rnd	same.rnd
laydisp	laydisp
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bsfml	<i>Black & Scholes formula</i>
-------	------------------------------------

Description

Black & Scholes analytical formula

Usage

```
BS.formula(type = c("call", "put"))
```

Arguments

type	type
------	------

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bsgreeks	<i>Black & Scholes greeks</i>
----------	-----------------------------------

Description

Calculate analytically Black & Scholes greeks

Usage

```
BS.greeks(X = NULL, ...)
```

Arguments

X	X
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bsImpvol	<i>Black & Scholes Implied volatility</i>
----------	---

Description

Calculate Black & Scholes Implied volatility

Usage

```
BS.ImpVol(P, under, strike, rfr, sigma, maty,
yield, interval = c(-20, 20),
calc.type = c("standard", "lognorm", "gammarec"),
opt.type = c("call", "put"))
```

Arguments

P	P
under	under
strike	strike
rfr	rfr
sigma	sigma
maty	maty
yield	yield
interval	interval
calc.type	calc.type
opt.type	opt.type

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bsmomt

Black & Scholes moments

Description

Calculate first four moments for Black & Scholes

Usage

```
BS.moments(BS = NULL, under, rfr, sigma, yield, maty)
```

Arguments

BS	BS
under	under
rfr	rfr
sigma	sigma
yield	yield
maty	maty

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

bsprice	<i>Black & Scholes price generic</i>
---------	--

Description

Generic method for Black & Scholes price

Usage

```
BS.price(under, ...)
## Default S3 method:
BS.price(under, strike, rfr, sigma, maty, yield, calc.type = c("standard",
"lognorm", "gammarec"), opt.type = c("call", "put"), ...)
```

Arguments

under	Underlying asset price.
strike	Strike price.
rfr	Risk free rate.
sigma	Volatility.
maty	Maturity.
yield	Yield
calc.type	Calculation type.
opt.type	Option type.
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

buypre	<i>Buying pressure indicator</i>
--------	----------------------------------

Description

Compute Buying pressure indicator (Technical Analysis)

Usage

```
buypre(Close, Low, lag = 5, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

capm

Capm - default method

Description

Default method for CAPM

Usage

```
Capm(PTF, ...)
## Default S3 method:
Capm(PTF, PTF_M, rf = NULL, rfr = NULL, ...)
```

Arguments

PTF	Matrix of returns, one series for each asset in the portfolio.
PTF_M	Vector of returns for the market portfolio
rf	Vector. Risk free asset returns
rfr	Numeric. Risk free rate
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example dataset
data(ex_ptf)
# Generate a random return risk free asset
rf = rnorm(NROW(ex_ptf), mean = 0.05, sd = 0.01)
# Calculate CAPM
Capm(PTF = ex_ptf[, -1], PTF_M = ex_ptf[, 1], rf)

## Not run:
## Example with real time series
ACME = get.fs("APKT", SName = "Acme Packet", from=as.Date("2010-01-01"))
ABTL = get.fs("ABTL", SName = "Autobytel", from=as.Date("2010-01-01"))

R_ptf = Ret(ptf, na.rm = TRUE);
# Return of the Benchmark portfolio (NASDAQ index)
R_NASDAQ = Ret(NASDAQ, na.rm = TRUE)

# Generate a random return risk free asset
rf = rnorm(NROW(R_ptf), mean = 0.05, sd = 0.01)
Capm(R_ptf, R_NASDAQ, rf)

## End(Not run)
```

cci

Commodity channel index

Description

Compute Commodity channel index (Technical Analysis)

Usage

```
cci(High, Low, Close, lag = 5, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cciv2

Commodity channel index v02

Description

Compute Commodity channel index v02 (Technical Analysis)

Usage

```
cci.v2(High, Low, Close, lag = 5, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

chaikin

Chaikin oscillator

Description

Compute Chaikin oscillator (Technical Analysis)

Usage

```
chaikin(Close, High = NULL, Low = NULL,
Vol = NULL, fast.lag = 3, slow.lag = 10,
plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Vol	VECTOR. Asset traded Volume.
fast.lag	fast.lag
slow.lag	slow.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

chaosacc

Chaos Accelerator oscillator

Description

Compute Chaos Accelerator oscillator (Technical Analysis)

Usage

```
chaosAcc (X)
```

Arguments

X	X
---	---

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

chist	<i>Custom histogram function</i>
-------	----------------------------------

Description

Custom histogram function

Usage

```
chist(x, nclass = min(max(round(NROW(x)/10), 10),  
  NROW(x)), density = c("kernel", "normal"),  
  kernel = c("gaussian", "epanechnikov", "rectangular",  
    "triangular", "biweight", "cosine", "optcosine"),  
  theme.params = getCurrentTheme(), main = "Histogram and Kernel Density Estimation",  
  xtitle = NULL, ytitle = NULL, legend = NULL,  
  show.legend = TRUE, normalised = FALSE, ...)
```

Arguments

x	x
nclass	nclass
density	density
kernel	kernel
theme.params	theme.params
main	main
xtitle	xtitle
ytitle	ytitle
legend	legend
show.legend	show.legend
normalised	normalised
...	...

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

chvol	<i>Chaikin volatility indicator</i>
-------	-------------------------------------

Description

Compute Chaikin volatility indicator (Technical Analysis)

Usage

```
Ch.vol(High, Low, Close, lag = 5, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cleanup	<i>Clean memory</i>
---------	---------------------

Description

Cleanup environment and (optionally) performs Garbage Collection

Usage

```
cleanup(keep = c(), env = parent.frame(), gc = FALSE)
```

Arguments

keep	CHARACTER. Vector of variables to keep in memory.
env	Environment from which objects are removed. Defaults to the environment from which this function is called.
gc	LOGICAL. If TRUE, garbage collection is performed to release memory. (Default = TRUE)

Value

VOID

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

clust	<i>Time series clusters</i>
-------	-----------------------------

Description

Create a simple cluster partition of a time series

Usage

```
TSClust(x, ...)

## Default S3 method:
TSClust(x, y=NULL, n_clust=5,
bk.type=c("quantile", "volatility", "uniform", "custom"),
pc_vol=0.1, win.size=10, custom_breaks=NULL,
lab.dig=0, ...)

## S3 method for class 'TSClust'
summary(object, funs = summary, ...)

## S3 method for class 'TSClust'
plot(x, smooth=FALSE, ...)
```

Arguments

<code>x</code> , <code>object</code>	Univariate time series or an object of class "TSClust"
<code>y</code>	<code>y</code>
<code>n_clust</code>	number of cluster
<code>bk.type</code>	Breaks type
<code>custom_breaks</code>	<code>custom_breaks</code>
<code>lab.dig</code>	<code>lab.dig</code>
<code>funs</code>	function to run inside <code>summary.TSClust</code>
<code>smooth</code>	<code>smooth</code>
<code>pc_vol</code>	<code>pc_vol</code>
<code>win.size</code>	<code>win.size</code>
<code>...</code>	further arguments accepted by "funs"

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

clv

Close Location value oscillator

Description

Compute Close Location value oscillator (Technical Analysis)

Usage

```
clv(Close, High = NULL, Low = NULL, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cmf

Chaikin Money Flow

Description

Compute Chaikin Money Flow (Technical Analysis)

Usage

```
cmf(Close, Low, High, Volume, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
Low	VECTOR. Low price.
High	VECTOR. High price.
Volume	Volume
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cmof

Chande Momentum Oscillator

Description

Compute Chande Momentum Oscillator (Technical Analysis)

Usage

```
cmof(X, lag = 5, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cofit

Cornish Fisher Transformation

Description

Cornish Fisher Transformation

Usage

```
cofit(X, p, k = NULL, s = NULL)
```

Arguments

X	Input matrix/sequence. Sequences are treated as one column matrices.
p	vector of probability threshold (interval [0, 1])
k	kurtosis (DEFAULT = NULL -> becomes kurt(X))
s	skewness (DEFAULT = NULL -> becomes skew(X))

Value

A matrix length(trsh) by NCOL(X) of computed quantiles

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

colinprs

Co-Linearity analysis

Description

This function performs a Co-Linearity analysis between the columns of X: Correlation factors between columns are computed, and pairs of columns with a correlation factor higher than a specified threshold are returned.

Usage

```
colin.pairs(X, trsh = 0.8)
```

Arguments

X	X
trsh	trsh

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

colinred

Co-Linearity reduction

Description

Perform a cross Co-Linearity analysis between the columns of Y and X, and for each Yi returns a reduced set of columns of X obtained after removing those columns of X that are too correlated (one for each co-linear pair). In the removal process, those columns of X that are most correlated to Yi are kept.

Usage

```
colin.reduce(Y, X, max.iter = 100, trsh = 0.85)
```

Arguments

Y	Y
X	X
max.iter	max.iter
trsh	trsh

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

combine

Combine Multiple objects

Description

This is a generic function, the default implementation combines Financial Series objects.

Usage

```
combine(...)
## Default S3 method:
combine(...)
## S3 method for class 'fs'
combine(..., which = "Close")
```

Arguments

... All input objects to be combined.
 which Which column/columns to extract from each input object

Value

Result depends on the implementation. The default method is a call to `combine.fs` which returns a matrix containing the selected columns from each input object.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## Not run:
# Load a set of assets
StartDate = as.Date("2010-01-01");
ACME = get.fs("APKT", SName = "Acme Packet", from = StartDate);
ABTL = get.fs("ABTL", SName = "Autobytel", from = StartDate);
CNAF = get.fs("CNAF", from = StartDate);
BIIB = get.fs("BIIB", SName = "Biogen", from = StartDate);
SONY = get.fs("SNE", SName = "Sony", from = StartDate);
ENI = get.fs("E", SName = "Eni", from = StartDate);

# Combine all series together in matrix format
Portfolio = combine(ACME, ABTL, CNAF, BIIB, SONY, ENI);
Portfolio[1:10, ]
# Combine Close and Volume data from each series
Portfolio2 = combine(ACME, ABTL, CNAF, BIIB, SONY, ENI, which = c("Close", "Volume"));
Portfolio2[1:10, ]

## End(Not run)
```

cosine

Cosine window

Description

Computes Cosine window of given length

Usage

```
cosine(N, normalized = TRUE)
```

Arguments

N Window length.
 normalized LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Cosine window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Cosine window of size 100
x = cosine(100)
# Plot the window
cplot(x
, main = "Cosine Window"
, legend = attr(x, "type")
)
# Generate a non-normalised window
y = cosine(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Cosine Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)
```

cplot

2-Dimensional Plotting

Description

Workhorse function for automatic plotting

Usage

```
cplot(X, base = NULL, xrange = NULL, yrange = NULL, theme.params =
getCurrentTheme(), xtitle = "" , xlabels = NULL , ytitle = "" , ylabels =
NULL , ytitle2 = "" , ylabels2 = NULL, show.xlabels = TRUE , show.ylabels =
TRUE , main = NULL , legend = NULL , legend.col = theme.params[["col"]],
show.legend = TRUE , shaded = FALSE, grid = TRUE , overrides = list(...),
new.device = FALSE, append = FALSE, multicolor = FALSE , ...)
```

Arguments

X	x coordinates of the plot
base	y coordinates of the plot
xrange	x axis range
yrange	y axis range
theme.params	Retrieve RAdamant graphical theme
xtitle	title for the x axis
xlabels	labels for x tick marks
ytitle	title for the y axis
ylabels	labels for y tick marks

<code>yttitle2</code>	title for the right-y axis
<code>ylabels2</code>	labels for right-y tick marks
<code>show.xlabels</code>	LOGICAL. Show labels on the x axis
<code>show.ylabels</code>	LOGICAL. Show labels on the y axis
<code>main</code>	Main title for the plot
<code>legend</code>	Add the legend
<code>legend.col</code>	Colors for the elements in the legend
<code>show.legend</code>	LOGICAL. Display the legend in the plot
<code>shaded</code>	LOGICAL. Insert shaded under the plot
<code>grid</code>	LOGICAL. Draw a grid
<code>overrides</code>	overrides list
<code>new.device</code>	open new.device window
<code>append</code>	append to existing plot
<code>multicolor</code>	multiple colors
<code>...</code>	additional arguments for generic functon "plot"

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[plot](#), [draw.grid](#), [draw.legend](#), [draw.projections](#), [draw.x.axis](#), [draw.x.title](#), [draw.y.title](#), [draw.y.axis](#)

Examples

```
# Main 2D plotting function "cplot"
cplot(
  # plot 4 random series
  X = matrix(cumsum(rnorm(1000)), ncol = 4)
  # Assign custom x-axis labels
  , xlabels = paste("t", 0:249, sep = "-")
  # Add shading area to the first series
  , shaded = TRUE
  , main = "Sample 2D Plot"
  , xtitle = "time"
  , ytitle = "value"
)
```

cplot3d

*3-Dimensional plotting***Description**

Workhorse function for 3D automatic plotting

Usage

```
cplot3d(x, y, z, fill = c("simple", "colormap", "gradient"),
main = "", xtitle = "", ytitle = "", ztitle = "",
xlim = range(x) + 0.1*diff(range(x))*c(-1, 1),
ylim = range(y) + 0.1*diff(range(y))*c(-1, 1),
zlim = range(z, na.rm = TRUE) + 0.1*diff(range(z, na.rm = TRUE))*c(-1, 1),
pre = NULL, post = NULL,
theme.params = getCurrentTheme(),
overrides = list(...), new.device = FALSE,
append = FALSE, axis = TRUE,
xlabels = NULL, ylabels = NULL,
zlabels = NULL,
show.xlabels = TRUE, show.ylabels = TRUE,
show.zlabels = TRUE, show.xticks = TRUE, show.yticks = TRUE,
show.zticks = TRUE, ...)
```

Arguments

x	x coordinates for the plot
y	y coordinates for the plot
z	z coordinates for the plot
fill	fill
main	main
xtitle	xtitle
ytitle	ytitle
ztitle	ztitle
xlim	xlim
ylim	ylim
zlim	zlim
xlabels	xlables
ylabels	ylabels
zlabels	zlabels
pre	pre
post	post
theme.params	theme.params
overrides	overrides
new.device	new.device

append	append
axis	axis
show.xlabels	show.xlabels
show.ylabels	show.ylabels
show.zlabels	show.zlabels
show.xticks	show.xticks
show.yticks	show.yticks
show.zticks	show.zticks
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

cramv

Cramers V

Description

Calculate Cramers V

Usage

```
cramv(x, y)
```

Arguments

x	x
y	y

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

crbtree

CRR Binomial Tree

Description

Option evaluation with Cox, Ross and Rubinstein Binomial Tree

Usage

```
CRR.BinTree(Nsteps, under, strike, rfr,
            sigma, maty, yield, life, ret.steps = FALSE)
```

Arguments

Nsteps	Nsteps
under	under
strike	strike
rfr	rfr
sigma	sigma
maty	maty
yield	yield
life	life
ret.steps	ret.steps

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

croscf

Cross correlation function

Description

Compute the cross correlation function for each pairs of variables ($Y_i X_j$)

Usage

```
cross.ccf(Y, X, ...)
## Default S3 method:
cross.ccf(Y, X, lag.max = 10, ci = 0.95, plot = TRUE, ...)
```

Arguments

<code>Y</code>	Matrix of data series (one column per variable)
<code>X</code>	Matrix of data series (one column per variable)
<code>lag.max</code>	Max lag to be computed by the cross correlation function (DEFAULT: 10)
<code>ci</code>	Confidence Interval (DEFAULT: 0.95)
<code>plot</code>	LOGICAL. If TRUE, results are plotted.
<code>...</code>	additional parameters accepted by the function <code>plot.cross.ccf</code> .

Value

A list of $N_y \times N_x$ cross correlation objects of the class "cross.acf"

Author(s)

RAdamant Development Team <team@r-adamant.org>

crosplot

Cross Plot

Description

Plot the input dependent variable Y versus each input independent variable X

Usage

```
cross.plot(Y, X, theme.params = getCurrentTheme(),
           xlabels = NULL, two.axis = TRUE,
           shaded.first = FALSE, overrides = NULL)
```

Arguments

<code>Y</code>	serie of the dependent variable
<code>X</code>	Matrix containing all independent variables (one column per variable)
<code>theme.params</code>	theme parameters (DEFAULT: <code>getCurrentTheme()</code>)
<code>xlabels</code>	serie of the labes associated to the rows of X (i.e. Time libels)(DEFAULT: NULL)
<code>two.axis</code>	LOGICAL. If TRUE, series are plotted on two axis (two scales).
<code>shaded.first</code>	LOGICAL. If TRUE, the variable Y is shaded.
<code>overrides</code>	list of parameters to override the theme. Must match by name the parameters defined by the theme (DEFAULT: NULL)

Value

VOID

Author(s)

RAdamant Development Team <team@r-adamant.org>

crscolin	<i>Cross collinearity</i>
----------	---------------------------

Description

Perform a cross Co-Linearity analysis between the columns of Y and X: Correlation factors between each column Yi and all columns of X are calculated for different time lags. Also pairs of columns of X with a correlation factor higher than a specified threshold are returned.

Usage

```
cross.colin(Y, X, max.lag = 8, trsh = 0.8)
```

Arguments

Y	Y
X	X
max.lag	max.lag
trsh	trsh

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

cumfun	<i>Cumulative functions</i>
--------	-----------------------------

Description

Cumulative max / min / Mean / Standard Deviation / Variance / sum on each column of the input matrix.

Usage

```
cumMax(X, lag = 0, padding = NA, na.rm = FALSE)
```

Arguments

X	Input matrix/sequence
lag	vector of integer lags. If lag >= 0 data are shifted to the right, else to the left. (DEFAULT = 0)
padding	value used to initialise the output matrix (DEFAULT = NA)
na.rm	LOGICAL. If TRUE, N-lag entries are removed from the output. Also NA in the input are replaced by -Inf (DEFAULT = FALSE)

Details

Sequences are treated as one-column matrices

Value

A matrix of cumulative maximums of X. Number of rows depends on the na.rm parameter. Number of columns is NCOL(X)

Author(s)

RAdamant Development Team <team@r-adamant.org>

[lew](#)

dataset	<i>Example datasets for portfolio and time series analysis</i>
---------	--

Description

ex_ts: Univariate timeseris of 126 observations;
ex_ptf: Matrix of returns: 60 rows and 8 columns. The first column is taken as a "market fund" and the other 7 columns are 8 possible indexes. ex_fs: An object of class "fs" containing financial series: 252 rows and 6 columns.

Usage

```
data(ex_ts)
data(ex_ptf)
data(ex_fs)
data(ex_credit)
```

Source

Artificially created.

decimals	<i>Count decimal</i>
----------	----------------------

Description

Count decimal

Usage

```
decimals(x, max.digits = 10, ...)
```

Arguments

x	x
max.digits	max.digits
...	...

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

decscal	<i>Decimal scale</i>
---------	----------------------

Description

Compute decimal scale of a vector

Usage

```
Decscal(x, scale = 0.1)
```

Arguments

x	x
scale	scale

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

dema

*Double EMA***Description**

Compute multiple Double EMA on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$

Usage

```
dema(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

X	X
win.size	win.size
plot	LOGICAL. If TRUE plot is returned.
\dots	Further arguments to or from other methods.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
 DEMA is a weighted combination of EMA: $2 \cdot \text{EMA}(X) - \text{EMA}(\text{EMA}(X))$.
 Smoothing factor: $\lambda = 2/(\text{win.size}+1)$.

# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
dema(x, 10)

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
dema(x, 30, plot = TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
```

```
# single lag
dema(ex_fs, 30, plot=TRUE)

## End(Not run)
```

demark

DeMark indicator

Description

Compute DeMark indicator (Technical Analysis)

Usage

```
demark(High, Low, Close, lag = 5, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

RAdamant Development Team <team@r-adamant.org>

dgev

Generalised Extreme Value (GEV)

Description

Generalised Extreme Value (GEV) - Density function

Usage

```
dgev(X, mu = 0, xi = 0.1, sigma = 1)
```

Arguments

X	X
mu	mu
xi	xi
sigma	sigma

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

dgpd

Generalised Pareto Distribution (GPD)

Description

Generalised Pareto Distribution (GPD) - Density function

Usage

```
dgpd(X, xi = 0.1, sigma = 1, trsh = 0)
```

Arguments

X	X
xi	xi
sigma	sigma
trsh	trsh

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

dma

Derivative Moving Averages

Description

Compute multiple Derivative Moving Averages on the input data, one for each column of `X[, i]` and window size `win.size[j]`.

Usage

```
dma(X, fast.win = 5, slow.win = 28, plot = FALSE, ...)
```

Arguments

<code>X</code>	<code>X</code>
<code>fast.win</code>	<code>fast.win</code>
<code>slow.win</code>	<code>slow.win</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Formula: $100 * (\text{movMax}(\text{SMA}(X, \text{fast.win}), \text{slow.win}) - \text{movMin}(\text{SMA}(X, \text{fast.win}), \text{slow.win})) / X$.

Value

A object of class 'ma' with attributes `type = "DMA"` and `'win.size'` as from the corresponding input parameters `[fast.win,slow.win]`:

- matrix of size `NROW(X)` by `NCOL(X)` where each column is the moving average of the corresponding column of `X`.

edwdist	<i>Edgeworth distribution</i>
---------	-------------------------------

Description

Simulate empirical Edgeworth distribution

Usage

```
EdgeWorthDist(init, Nsteps, p=0.5)
```

Arguments

init	init
Nsteps	Nsteps
p	p

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

edwprice	<i>Edgeworth option price</i>
----------	-------------------------------

Description

Option evaluation with Edgeworth adapted Binomial Tree

Usage

```
Edgeworth.price(init, under, strike, rfr, sigma, maty, yield)
```

Arguments

init	init
under	under
strike	strike
rfr	rfr
sigma	sigma
maty	maty
yield	yields

Author(s)

RAdamant Development Team <team@r-adamant.org>

ema	<i>Exponential Moving Average</i>
-----	-----------------------------------

Description

Compute multiple Exponential Moving Averages on the input data, one for each column of X[, i] and window size win.size[j].

Usage

```
ema(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = 10).
plot	LOGICAL. Return plot.
...	Additional parameters accepted by the function Mmovav.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
Smoothing factor: $\lambda = 2/(\text{win.size}+1)$.

Value

A object of class 'ma' with attributes type = "EMA" and 'win.size' as given by the corresponding input parameter:
- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
ema(x, 10)
# compute moving average with multiple lags
ema(x, c(10,20))

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
ema(x, 30, plot = TRUE)
# multiple lags
ema(x, seq(5,50,10), plot=TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
ema(ex_fs, 30, plot=TRUE)
# multiple lags
ema(ex_fs, seq(5,50,10), plot=TRUE)

## End(Not run)
```

Description

Compute multiple Trend corrected Exponential Moving Averages on the input data, one for each column of X[, i] and window size win.size[j].

Usage

```
emat(X, win.size = NROW(X), alpha = 0.1, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = NROW(X)).
alpha	weight for the trend correction (DEFAULT: 0.1)
plot	LOGICAL. Return plot.
...	Additional parameters accepted by function ema.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
 EMAT is a dynamic model regulated by the smoothing factors $\lambda = 2/(\text{win.size}+1)$ and α .

Value

A object of class 'ma' with attributes type = "EMAT", 'lambda' and 'alpha':
 - matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

```

eom

*Ease of Movement oscillator***Description**

Compute Ease of Movement oscillator (Technical Analysis)

Usage

```
eom(Close, High = NULL, Low = NULL, Vol = NULL, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Vol	VECTOR. Asset traded Volume.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

epma

*end Point Moving Averages***Description**

Computes multiple End-Points Moving Averages on the input data, one for each column of X[, i] and window size win.size[j].

Usage

```
epma(X, win.size = 10, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable)
<code>win.size</code>	Vector of moving average window sizes (lags) to be applied on the data <code>X</code> . (DEFAULT = <code>NROW(X)</code>).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by the function <code>Movav</code>

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
 EPMA Weights are given by a win.size-long line with angular coefficient = -3 and intercept = $2 \cdot \text{win.size} - 1$

Value

A object of class 'Movav' with attributes type = "EPMA" and 'win.size' as from the corresponding input parameter:
 - matrix of size `NROW(X)` by `NCOL(X)*length(win.size)` where each column is the moving average of length `win.size[i]` of the corresponding column of `X`.

Author(s)

RAdamant Development Team <team@r-adamant.org>

## End(Not run)
```

erf

Elder Ray force

Description

Compute Elder Ray force (Technical Analysis)

Usage

```
erf(Close, High = NULL, Low = NULL, lag = 13, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

erfi

Elder Ray force index

Description

Compute Elder Ray force index (Technical Analysis)

Usage

```
erfi(X, Volume, lag = 13, plot = FALSE, ...)
```

Arguments

X	X
Volume	VECTOR. Asset traded Volume.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

extrdd	<i>Maximum / Minimum drawdown</i>
--------	-----------------------------------

Description

Calculate Mximum / Minimum DrawDown

Usage

```
ExtremeDD(DD, FUN, lag = 1, rolling = FALSE, plot = TRUE, ...)
```

Arguments

DD	OBJECT of class "drawdown"
FUN	FUN
lag	INTEGER. Number of lag periods.
rolling	rolling
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

factor	<i>Factorise variable</i>
--------	---------------------------

Description

Factorise numerical variables according to defined number of bins

Usage

```
Factorise(X, nseg,
  seg.type = c("freq_equal", "width_equal"),
  na.replace = NULL)
extrBreak(var, Factors)
## S3 method for class 'Factorise'
print(x, ...)
```

Arguments

<code>X</code>	Numeric input matrix.
<code>nseg</code>	INTEGER / VECTOR. Number of segments to factorise numerical variables.
<code>seg.type</code>	CHARACTER. Type of segments to create. (Default = "equal frequencies")
<code>na.replace</code>	CHARACTER / NUMERIC. Value to replace missing. If NULL missing values are not considered in the computation.
<code>var</code>	Character. Name(s) of the variable(s) for which to extract the breaks.
<code>Factors, x</code>	an object of class "Factorise"
<code>...</code>	Further arguments to or from other methods.

Details

The function `extrBreak` allows to extract the breaks of one or more variables from an object of class `Factorise`.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example data set "credit"
data(ex_ptf)
## Create matrix of factorised variables
# one segment
fact = Factorise(ex_ptf, nseg = c(2,4), seg.type="f")
fact
# two segments
fact = Factorise(ex_ptf, nseg = c(2,4), seg.type="f")
fact

# load example data set
data(ex_credit)
# consider only the numerical variable
num = ex_credit[,c(3,6,14)]
# four segments
fact = Factorise(num, nseg = c(2,3,4,5), seg.type="f")
fact

# extract the breaks for one variable
extrBreak("duration", Factors=fact)
# extract the breaks for two variables
extrBreak(c("duration","age"), Factors=fact)
# try to extract the breaks for a variable that doesn't exist in the data...
extrBreak("sex", Factors=fact)
```

fft

*Customised Fast Fourier Transform***Description**

Computes FFT on each column of X. For Financial series objects (class 'fs'), Close data is extracted.

Usage

```
FFT(x, ...)
```

Default S3 method:

```
FFT(x
, Fs = 1
, half = FALSE
, window = NULL
, plot = TRUE
, optimised = TRUE
, ...
)
```

Arguments

x	Matrix of data series (one column per variable).
Fs	Sampling frequency (DEFAULT: 1).
half	LOGICAL. If TRUE, half spectrum indices are computed.
window	Function or character name of the window used to smooth the data (DEFAULT: NULL. Results in rectangular window).
plot	LOGICAL. If TRUE, frequency spectrum is plotted.
optimised	LOGICAL. If TRUE, the number of FFT evaluation points is the next integer (power of 2) that allows the fast computation
...	Additional parameters passed to the plot (in the default implementation)

Value

An object of the class 'FFT'. It is a complex matrix (same number of columns as x) of frequency data. The following attributes are attached to the object:

Fs	The input Fs parameter
window	The window function used to smooth the input data
freq	The frequencies where the FFT was evaluated
fpoints	The array indices where the frequency points relative to 'freq' are stored
half	The input half parameter.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Load sample financial series data
data(ex_fs)

# Frequency Analysis - Full spectrum
FFT(ex_fs)

# Frequency Analysis - Half spectrum (right side) and use blackman windowing, remove area
FFT(ex_fs, half = TRUE, window = blackman, shaded = FALSE)

# Show periodicity instead of frequency, and use hamming window
FFT(ex_fs, half = TRUE, window = hamming, show.periodicity = TRUE)

# Use kaiser window, zoom in to show only 10% of the half frequency spectrum, use semilog
FFT(ex_fs, half = TRUE, window = kaiser, show.periodicity = TRUE, zoom = 10, semilog = TRUE)

# Multiple FFT on matrix input.
# Use Bartlett-Hann window, zoom in to show only 20% of the full frequency spectrum, use semilog
FFT(ex_fs[,], window = barthann, zoom = 20, semilog = TRUE, shaded = FALSE)
```

finplot

Plot financial time series

Description

Generic plotting for financial data. Produces a two panels plot

Usage

```
fin.plot(X
, top.vars = c("Close", "High", "Low")
, bottom.vars = "Volume"
, style = c("default", "candlestick")
, snames = attr(X, "SName")
, xlabels = rownames(X)
, main = ""
, main2 = ""
, ytitle = ""
, ytitle2 = ""
, theme.top = getCurrentTheme()
, overrides = list(...)
, theme.bottom = getCurrentTheme()
, overrides2 = NULL
, ...
)
```

Arguments

X	Input matrix of data to be plotted.
top.vars	Indices or names of the columns for the top plot.
bottom.vars	Indices or names of the columns for the bottom plot.

<code>style</code>	Not used. For future releases.
<code>snames</code>	Names of the series being plotted.
<code>xlabels</code>	labels for the x-axis.
<code>main</code>	Main title for the top plot.
<code>main2</code>	Main title for the bottom plot.
<code>ytitle</code>	Title for the y-axis (top plot).
<code>ytitle2</code>	Title for the y-axis (bottom plot).
<code>theme.top</code>	Theme parameters list for the top plot (DEFAULT = <code>getCurrentTheme()</code>).
<code>overrides</code>	List of parameters to override theme for the top plot. Only parameters that match those defined by the theme are overridden (DEFAULT <code>list(...)</code>).
<code>theme.bottom</code>	Theme parameters list for the bottom plot.
<code>overrides2</code>	List of parameters to override theme for the bottom plot. (DEFAULT = <code>NULL</code>).
<code>...</code>	Additional parameters passed to the <code>cplot</code> function. Also used to quickly specify theme overrides.

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

`cplot`.

Examples

```
# Load sample financial series data
data(ex_fs)
# Plot the data
plot(ex_fs)
# Change the style and color of the bottom chart
plot(ex_fs, overrides2 = list(type = "l", col = "grey"))
```

firsthit

First Hit time barrier (Brownian motion)

Description

Calculate expected time of the First Hitting for a Brownian motion

Usage

```
FirstHit(B, S0, mi, geom = FALSE, sigma = NULL)
```

Arguments

<code>B</code>	<code>B</code>
<code>S0</code>	<code>S0</code>
<code>mi</code>	<code>mi</code>
<code>geom</code>	<code>geom</code>
<code>sigma</code>	<code>sigma</code>

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

flogbuf

Flush the log buffer to file

Description

Flush the content of the log buffer to file and console.

Usage

```
flushLogBuffer(console = FALSE, logfile = getLogFile(env = env), env = getOption("RAdamant"))
```

Arguments

console	LOGICAL. If TRUE, content is sent to console.
logfile	The path to the log file.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Save content of the log buffer to file and print content to console as well  
flushLogBuffer(console = TRUE);
```

fmeas	<i>Four Measures indexes</i>
-------	------------------------------

Description

Calculate the Four Measures indexes

Usage

```
FourMeasures(PTF, ...)
## Default S3 method:
FourMeasures(PTF, PTF_M, rf = NULL, rfr = 0, ...)
## S3 method for class 'Capm'
FourMeasures(PTF, rfr = 0, ...)
```

Arguments

PTF	Input portfolio or an object of class "Capm"
PTF_M	Market/benchmark portfolio
rfr	risk free rate
rf	risk free asset
...	Further arguments to or from other methods

Value

Return a matrix containing the values for the following indexes: Sharpe, Treynor, Jensen and Appraisal

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[Sharpe, Treynor, Jensen, Appraisal](#)

fmlmreg	<i>Extract formula from regression object</i>
---------	---

Description

Extract formula from regression ("reg" / "mreg") object

Usage

```
## S3 method for class 'reg'
formula(x, ...)
## S3 method for class 'mreg'
formula(x, ...)
```

Arguments

x	An object of class "reg" / "mreg"
...	Further arguments passed to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

forcidx

Force index

Description

Compute Force index (Technical Analysis)

Usage

```
forcidx(X, Volume, lag = 5, sth = TRUE,
sth.lag = 13, mov = sma, plot = FALSE, ...)
```

Arguments

X	X
Volume	Volume
lag	INTEGER. Number of lag periods.
sth	sth
sth.lag	sth.lag
mov	mov
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods

Note

frama	<i>Fractal Moving Average</i>
-------	-------------------------------

Description

Fractal Moving Average, computed on each column of the input data X and for each pair (fast.win[i], slow.win[i]).

Usage

```
frama(X, win.size = 10, tau = 4.6,
      keep.lambda = FALSE, keep.ER = FALSE, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of window sizes (lags) (DEFAULT = 10).
tau	controls how the smoothing factor lambda is calculated ($\lambda = \exp(\tau \cdot \log(ER))$) (DEFAULT = 4.6).
keep.lambda	LOGICAL. If TRUE, adaptive smoothing factor lambda is returned as an attribute (DEFAULT = FALSE).
keep.ER	LOGICAL. If TRUE, adaptive Efficiency Ratio ER is returned as an attribute (DEFAULT = FALSE).
plot	LOGICAL. Return plot.
...	Additional parameters for future development.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'Movav' with attributes type = "FRAMA", 'lambda' and 'ER' as required and 'win.size' and 'tau' given by the corresponding input parameters:
 - matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
frama(x, 20, tau=4.6)
# compute moving average with multiple lags
frama(x, c(40,50,60), tau=5.0)

## Not run:
# refine results of moving average
setCurrentTheme(2)
# single lag
frama(x, 20, tau=4.6, plot = TRUE)
# multiple lags
frama(x, c(10,15,30,50), tau = 4.0, plot=TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
frama(ex_fs, 20, tau=4.6, plot = TRUE)
# multiple lags
frama(ex_fs, c(10,15,30,50), tau = 4.0, plot=TRUE)

## End(Not run)
```

fresvar

Fitted / Residual for VAR

Description

Get Fitted values and Residuals from a VAR model

Usage

```
## S3 method for class 'VecAr'
fitted(object, Coefs, ar.lags, ...)
```

Arguments

object	object
Coefs	Coefs
ar.lags	ar.lags
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

fsevecar

VAR Forecast Standard Error

Description

Compute forecast standard error for VAR model

Usage

```
FSE.VecAr(X, steps, ...)
```

Arguments

X	X
steps	steps
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

fulp

Full price

Description

Compute Full price (Technical Analysis)

Usage

```
fullP(Close, Open, High, Low, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
Open	VECTOR. Open price.
High	VECTOR. High price.
Low	VECTOR. Low price.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

funcomx

Function comment

Description

Given an input file, this functions created an index based commented version of the file.

Usage

```
func.comment.idx(control.df =
data.frame(FNAME = c(), FCODE = c(),
AREA = c(), SECTION = c(), CLASS = c()),
infile = NULL, incode = NULL, outfile = NULL, max.dgt = 3)
```

Arguments

control.df	List of function names. See Details
infile	Input file (Full path: Mandatory).
incode	Input code array (Alternative to infile: Mandatory). Each entry is considered to be a line of code.
outfile	Output commented file (Full path: Optional). If provided, an output file is generated.
max.dgt	Controls the number of digits to be used on each section of the comment.

Details

This data frame is a list of function names:

- FNAME = Name of the function
- FCODE = code identifier for the function. (a-Z)(0-9).
- AREA = Macro area (Description) classification for the function.
- SECTION = Section (Description) classification for the function (Sub-AREA)
- CLASS = The class of the returned object.

Value

String array where every entry is a line of code. Each original line of the input code is preceded by a special comment.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
#### EXAMPLE #####
tst = data.frame(FNAME = c("sd", "lm")
, FCODE = c("SD", "LM")
, AREA = c("s5", "s2")
, SECTION = c("s1", "s1")
, CLASS = c("c1", "c2")
);

incode = rbind(paste("sd =", as.character(deparse(args(sd)))[1])
, as.matrix(deparse(body(sd)))
, ""
, ""
, paste("lm =", as.character(deparse(args(lm)))[1])
, as.matrix(deparse(body(lm)))
)
func.comment.idx(tst, incode = incode, max.dgt=3)
```

funlcnt

Function line counting

Description

Given a package name or a list of functions, for each function X in the package or the list it counts the lines of code, the number of subcalls made to any other function Y of the list/package and the number of other functions that make calls to the function X.
Results are plotted if requested.

Usage

```
func.line.cnt(package = NULL, plot = TRUE,
qtz.type = "NONE", qtz.nbins = 10, qtz.cutoff = 30)
```

Arguments

package	CHARACTER. Single name of the package to load or array list of function names.
plot	LOGICAL. If TRUE, results are plotted on bar charts.
qtz.type	CHARACTER. qtz.type = "NONE" "LINEAR" "LOG".
qtz.nbins	INTEGER. Number of bins to be computed. Used only when qtz.type != "NONE". (Default = 10)
qtz.cutoff	Used only when qtz.type = "LOG". (Default = 30)

Details

Parameter "qtz.type" is Case Insensitive. It states the type of quantization to be used to set bin size for the barchart plotting the distribution of lines of code. Values:

- If "NONE", bin size is set to 1.
- If "LINEAR", qtz.nbins equispaced intervals are computed.
- If "LOG", qtz.nbins log-spaced intervals are computed based on qtz.cutoff.

Parameter "qtz.bins": qtz.nbins equispaced intervals are computed on a $\log(x/\text{qtz.cutoff})$ scale. This creates more intervals in the range $0 < x < \text{qtz.cutoff}$.

Value

Data frame containing the stats for each function in the input list/package:

- fcn.name = Name of the function
- fcn.lines = Number of lines of code
- fcn.subcalls = Calls made to other functions
- fcn.called = Number of function calling the function

Author(s)

RAdamant Development Team <team@r-adamant.org>

fwmovav

Front Weighted Moving Averages

Description

fw1: Computes multiple Front Weighted 32 Day Moving Averages on the input data, one for each column $X[i]$.

fw2: Computes multiple Front Weighted 18 Day Moving Averages on the input data, one for each column $X[i]$.

fw3: Computes multiple Front Weighted 2 Day Moving Averages on the input data, one for each column $X[i]$.

Usage

```
fw1(X, plot = FALSE, ...)
fw2(X, plot = FALSE, ...)
fw3(X, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
plot	LOGICAL. Return plot.
...	Additional parameters accepted by function movav.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'ma' with attributes type = "FW1/2/3" and 'weights' given by the FW1/2/3 filter weights:

- matrix of size NROW(X) by NCOL(X) where each column is the moving average of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

garch	<i>Garch</i>
-------	--------------

Description

Estimate Garch models

Usage

```
Garch(x, ...)
## Default S3 method:
Garch(x, Y=NULL, order=c(alpha=1,beta=1), phi=0, delta=0,
type=c("garch","mgarch","tgarch","egarch"), prob=c("norm","ged","t"), ...)
```

Arguments

x	Univariate time series, usually returns
Y	Exogenous regressors for the Mean Equation
order	Garch order
type	Garch type.
prob	Probability density for the innovations.
phi	Phi pars
delta	Delta pars
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

gauss

*Gauss window***Description**

Computes Gauss window of given length

Usage

```
gauss(N, normalized = TRUE, sigma = 0.5)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.
sigma	Standard Deviation - Expansion factor. $\sigma \leq 0.5$.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Gauss window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Gauss window of size 100
x = gauss(100)
# Plot the window
cplot(x
, main = "Gauss Window"
, legend = attr(x, "type")
)

# Generate a non-normalised window
y = gauss(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Gauss Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)

# Generate another window with smaller expansion factor
z = gauss(100, normalized = FALSE, sigma = 0.1)
# Compare the two expansion factors
cplot(cbind(y, z)
, main = "Gauss Window"
, legend = paste("Gauss (sigma = ", c(0.5, 0.1), ")")
, type = c("l", "o")
, xlab.srt = 0
)
```

)

gdema

*Generalised Double EMA***Description**

Compute multiple Generalised Double EMA on the input data, one for each column of X , i] and window size $\text{win.size}[j]$.

Usage

```
gdema(X, win.size = NROW(X), alpha = 0.7, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
<code>alpha</code>	weight in the interval $[0, 1]$. (DEFAULT: 0.7)
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by function <code>ema</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
 GDEMA is a weighted combination of EMA and DEMA: $\alpha * \text{DEMA}(X) + (1 - \alpha) * \text{EMA}(X)$.
 Smoothing factor: $\lambda = 2 / (\text{win.size} + 1)$.

Value

A object of class 'ma' with attributes `type = "GDEMA"` and `'win.size'` as given by the corresponding input parameter:
 - matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) * \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

Author(s)

## End(Not run)
```

getacfci

Normal confidence intervals for correlation

Description

Compute the Normal confidence intervals for correlation and partial autocorrelation data

Usage

```
get.acf.ci(X, ci = 0.95)
```

Arguments

X	X
ci	ci

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

getfs

*Download Financial Series data from Yahoo!***Description**

Download Yahoo! time series data and returns a Financial Series (fs) object.

Usage

```
get.fs(symbol = NULL
, SName = NULL
, from = as.Date("1950-01-01")
, to = Sys.Date()
, strip.spaces = TRUE
, strip.char = "."
)
```

Arguments

symbol	Stock symbol to download.
SName	Name that will be assigned to the time series. If NULL (default) the name is retrieved from Yahoo!
from	Date object. The start date of the time series (DEFAULT = as.Date("1950-01-01")).
to	Date object. The end date of the time series (DEFAULT = Sys.Date()).
strip.spaces	LOGICAL. If TRUE, spaces from SName are replaced with the value of strip.char (DEFAULT = TRUE).
strip.char	The character used to replaces spaces in SName (DEFAULT = ".").

Value

A financial Time Series object. This is a matrix of Yahoo! daily data with columns (Open, High, Low, Close, Volume, Adj.Close). The following attributes are attached to the object:

SName	The Name/Description of the financial series.
Symbol	the input stock symbol.

Author(s)

gini

Gini index

Description

Calculate Gini index based on the results of a classification model.

Usage

```
Gini(x, ...)
## Default S3 method:
Gini(x, ...)
## S3 method for class 'scorecard'
Gini(x, glob = TRUE, ...)
```

Arguments

<code>x</code>	An object of class "scorecard" or a matrix containing "Number of Goods" and "Number of bads"
<code>glob</code>	Logical. If TRUE the function returns the Gini index for the model otherwise, it returns a separate index for each variable
<code>...</code>	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example data set
data(ex_credit)

## Generate Score Card
data = ex_credit[, -1]
target = ex_credit[, 1]
# Two examples of scorecard
sc2 = Score.card(X=data, Y=target, nseg = c(2,4))
sc3 = Score.card(X=data, Y=target, nseg = c(2:5))

# calculate global Gini
Gini(sc2, glob=TRUE)
Gini(sc3, glob=TRUE)
# calculate Gini for each variable
Gini(sc2, glob=FALSE)
Gini(sc3, glob=FALSE)
```

glogbuf

Retrieve the content of the Log Buffer

Description

Retrieve the content of the Log Buffer.

Usage

```
getLogBuffer(env = getOption("RAdamant"))
```

Arguments

<code>env</code>	The environment where the info is stored (DEFAULT = getOption("RAdamant")).
------------------	---

Value

Returns the content of the log buffer.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve content of the log buffer.
getLogBuffer();
```

gmma

*Guppy's Multiple EMA***Description**

Compute Guppy's Multiple EMA on the input data, one for each column of $X[, i]$.

Usage

```
gmma(X, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by function <code>ema</code> .

Details

GMMA is two sets (short and long window sizes) of six EMA:

- Short Windows: 3, 5, 8, 10, 12, 15
- Long Windows: 30, 35, 40, 45, 50, 60.

Value

A object of class 'ma' with attributes `type = "GMMA"` and `'win.size'` as given by the corresponding input parameter:

- matrix of size $NROW(X)$ by $NCOL(X)*12$ with twelve moving averages for each column of X .

Author(s)

RAdamant Development Team <team@r-adamant.org>

RAdamant Graphical utilities

Description

Graphical utilities used by the plotting functions

Author(s)

RAdamant Development Team <team@r-adamant.org>

hamming	<i>Hamming window</i>
---------	-----------------------

Description

Computes Hamming window of given length

Usage

```
hamming(N, normalized = TRUE)
```

Arguments

N Window length.

normalized LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Hamming window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Hamming window of size 100
x = hamming(100)
# Plot the window
cplot(x
, main = "Hamming Window"
, legend = attr(x, "type")
)
# Generate a non-normalised window
y = hamming(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Hamming Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)
```

hann	<i>Hann window</i>
------	--------------------

Description

Computes Hann window of given length

Usage

```
hann(N, normalized = TRUE)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Hann window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Hann window of size 100
x = hann(100)
# Plot the window
cplot(x
, main = "Hann Window"
, legend = attr(x, "type")
)
# Generate a non-normalised window
y = hann(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Hann Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)
```

heas	<i>Heikin - Ashi techniques</i>
------	---------------------------------

Description

Compute Heikin - Ashi techniques (Technical Analysis)

Usage

```
he_as(Close, Open, High, Low, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
Open	VECTOR. Open price.
High	VECTOR. High price.
Low	VECTOR. Low price.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

hhv	<i>Highest high</i>
-----	---------------------

Description

Compute Highest high (Technical Analysis)

Usage

```
hhv(X, lag, na.rm = TRUE)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
na.rm	na.rm

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

hill

Hill function

Description

Hill function: Approximated gamma parameter of the Generalised Pareto distribution

Usage

```
Hill(X, trsh)
```

Arguments

X	Input matrix/sequence. Sequences are treated as one column matrices.
trsh	vector of probability threshold (interval [0, 1])

Value

A matrix length(trsh) by NCOL(X) of computed quantiles

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

hma

Hull Moving Averages

Description

Compute multiple Hull Moving Averages on the input data, one for each column of X[, i] and window size win.size[j].

Usage

```
hma(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable)
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = NROW(X)).
plot	LOGICAL. Return plot.
...	Further arguments to or from other methods

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

HMA is a combination of WMA: $\text{WMA}(2 * \text{WMA}(X, \text{win.size}/2) - \text{wma}(X, \text{win.size}), \text{sqrt}(\text{win.size}))$.

Value

A object of class 'ma' with attributes type = "HMA" and 'win.size' as from the corresponding input parameter:

- matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) * \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[wma](#)

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
hma(x, 10)
# compute moving average with multiple lags
hma(x, c(10,20))

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
hma(x, 30, plot = TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
hma(ex_fs, 30, plot=TRUE)

## End(Not run)
```

Description

Computes historical returns on investment and two-sided VaR. Analysis of the performance of the returns as a function of the holding period. For Financial series objects (class 'fs'), Close data is processed.

Usage

```
hroi(X
, lag = 1
, mode = c("auto", "range", "selected")
, autolag.start = 1
, range.step = 1
, log = TRUE
, VaR.type = "norm"
, p = 0.05
, ...
)
```

Arguments

	h
	Input matrix of data to be plotted.
lag	The maximum lag used to compute returns (DEFAULT = 1).
mode	Controls how the lags are computed. See details.
autolag.start	Starting lag value for the case where mode = "auto" (DEFAULT = 1). See details.
range.step	Lag increment used for the case where mode = "range" (DEFAULT = 1). See details.
log	LOGICAL. If TRUE, log returns are computed. DEFAULT = TRUE.
VaR.type	The distribution used for VaR calculation. See VaR for details.
p	The confidence interval used for VaR calculation. (DEFAULT = 0.05)
...	Additional parameters passed to the VaR function.

Details

For each input time series, returns are calculated for multiple lags, hence average and two-sided Value at Risk (Profit & Loss with p The number and the way lags are computed is controlled by the mode parameter:

- auto: All lags between autolag.start and max(lag) (DEFAULT option)
- range: All lags between min(lag) and max(lag) with increment given by range.step
- selected: Only selected lags are calculated.

Value

An instance of the class 'roi'. This is a list of length given by the number of columns of the input X. Each entry is a matrix with columns [Return (Avg.), VaR (Profit), VaR (Loss)] where the rows are calculated for each lag. The following attributes are attached to the object:

log	The input log parameter.
lag	The lags for which returns are computed.

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[Ret](#), [VaR](#), [plot.roi](#).

Examples

```
# Load sample financial series data
data(ex_fs)

# Historical returns for all lags between 1 and 10 days
hroi(ex_fs, lag = 10)

# Historical returns for lags between 2 and 10 with increment 2
hroi(ex_fs, lag = c(2, 10), mode = "range", range.step = 2)

# Historical returns for selected lags
hroi(ex_fs, lag = c(2, 5, 10), mode = "selected")

# Analyse the performance of the returns up to 200 days and plot results
plot(hroi(ex_fs, lag = 200, log = FALSE), xlab.srt = 0)
```

hvar

Historical Value at Risk

Description

Compute historical VaR on each column of the input matrix

Usage

```
hVaR(X, p = 0.05, centered = FALSE)
```

Arguments

X	Input matrix/sequence. Sequences are treated as one column matrices.
p	vector of probabilities (DEFAULT = 0.05)
centered	LOGICAL. If TRUE, input data are standardised

Value

A matrix length(p) by NCOL(X) of computed quantiles

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

ichkh	<i>Ichimoku Kinko Hyo</i>
-------	---------------------------

Description

Compute Ichimoku Kinko Hyo (Technical Analysis)

Usage

```
Ichkh(Close, High, Low, plot = FALSE, ...)
```

Arguments

Close	close
High	high
Low	low
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

impulse	<i>Unitary impulse</i>
---------	------------------------

Description

Generates an impulse sequence of specified length

Usage

```
impulse(N, value = 1)
```

Arguments

N	Length of the impulse
value	value of the impulse (Default = 1)

Value

Impulse sequence of specified length

Author(s)

RAdamant Development Team <team@r-adamant.org>

in2woe

*Data to Weight of Evidence***Description**

Transform input data according to weight of evidence

Usage

```
input2woe(data, nseg, woe, ...)
```

Arguments

data	MATRIX or DATA.FRAME. Input data.
nseg	Integer or Vector. Number of segment to split the numerical variables.
woe	A matrix of results created by the function WeightEvid
...	Further parameter for the function Factorise

Details

Input data can contain both numerical and categorical variables. Numerical variables will be factorised according with the specified number of segments; categorical variables will be processed as they are (no aggregation for the existing classes).

The factorisation of the numerical variables is performed by the function [Factorise](#).

Each value in the input data will be replaced with the corresponding Weight of Evidence.

Value

A matrix with the same number of rows of the input data and number of columns given by:
 Number of categorical variables + Number of numerical variables * Number of segments.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example data set "credit"
data(ex_credit)
# calculate weight of evidence
input = ex_credit[, -1]
target = ex_credit[, 1]
woe = WeightEvid(data=input, target=target, nseg = 2:3, missing=FALSE)
# quick look of the results got from WeightEvid
head(woe)
# recode input data according to weight of evidence calculation
new = input2woe(data = input, nseg=2:3, woe=woe)
# quick look of the new data
head(new)
```

inertia	<i>Inertia oscillator</i>
---------	---------------------------

Description

Compute Inertia oscillator (Technical Analysis)

Usage

```
Inertia(X, lag, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
...	Further arguments to or from other methods.

Note

invlogit	<i>Inverse Logit transformation</i>
----------	-------------------------------------

Description

Inverse Logit transformation

Usage

```
inv.logit(y)
```

Arguments

y	y
---	---

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

invp	<i>Peizer-Pratt Inversion formula</i>
------	---------------------------------------

Description

Peizer-Pratt Inversion formula

Usage

```
InvPP (z, n)
```

Arguments

z	z
n	n

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

irsvecar	<i>VAR Impulse response</i>
----------	-----------------------------

Description

Compute and plot Impulse response function calculated for VAR model

Usage

```
IRS.VecAr(X, imp, resp = NULL, steps = 5, cum = TRUE, ortho = FALSE, ...)
```

Arguments

X	X
imp	imp
resp	resp
steps	steps
cum	cum
ortho	ortho
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

isfs

Check for inheritance from Financial Series class

Description

Check for inheritance from Financial Series class

Usage

```
is.fs(X)
```

Arguments

X The object to be checked.

Author(s)

RAdamant Development Team <team@r-adamant.org>

jbtest

Jaques-Brera normality test

Description

Compute Jaques-Brera normality test for each column of X

Usage

```
JB.test(X, plot.hist=FALSE)
```

Arguments

X Matrix of data series (one column per variable)
plot.hist LOGICAL. Return histogram.

Value

Matrix of Jaques-Brera scores and P-Value

Author(s)

RAdamant Development Team <team@r-adamant.org>

[kurt](#), [skew](#)

jensen	<i>Jensen index</i>
--------	---------------------

Description

Jensen: Calculate Jensen index for a portfolio
 Jensen.Capm: Get Jensen index from an object of class "Capm".

Usage

```
Jensen(PTF, ...)
## Default S3 method:
Jensen(PTF, PTF_M, rf = NULL, rfr = 0, ...)
## S3 method for class 'Capm'
Jensen(PTF, rfr = 0, ...)
```

Arguments

PTF	Input portfolio or an object of class "Capm"
PTF_M	Market/benchmark portfolio
rfr	risk free rate
rf	risk free asset
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

[Sharpe](#), [Treynor](#), [Appraisal](#)

jrbtree	<i>JR Binomial Tree</i>
---------	-------------------------

Description

Option evaluation with Jarrow and Rudd Binomial Tree

Usage

```
JR.BinTree(Nsteps, p, under, strike, rfr, sigma,
  maty, yield, life, ret.steps = FALSE)
```

Arguments

Nsteps	Nsteps
p	p
under	under
strike	strike
rfr	rfr
sigma	sigma
maty	maty
yield	yield
life	life
ret.steps	ret.steps

kaiser

Kaiser window

Description

Computes Kaiser window of given length (Discrete Prolate Spheroidal Sequence approximation).

Usage

```
kaiser(N, normalized = TRUE, alpha = 3)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.
alpha	Shape factor (DEFAULT = 3).

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Kaiser window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Kaiser window of size 100
x = kaiser(100, FALSE)
# Plot the window
cplot(x
, main = "Kaiser Window"
, legend = attr(x, "type")
)

# Generate another window with different smoothing factor
y = kaiser(100, normalized = FALSE, alpha = 6)
# Compare the two windows
cplot(cbind(x, y)
, main = "Kaiser Window"
, legend = paste("Kaiser (alpha = ", c(3, 6), ")", sep = "")
, type = c("l", "o")
, xlab.srt = 0
)
```

kama

Kauffman Adaptive Moving Average

Description

Kauffman Adaptive Moving Average, computed on each column of the input data X and for each pair (fast.win[i], slow.win[i]).

Usage

```
kama(X, fast.win = 2, slow.win = 30, lag = 5,
keep.lambda = FALSE, keep.ER = FALSE, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
fast.win	vector of fast window sizes (fast lags) (DEFAULT = 2)
slow.win	vector of slow window sizes (slow lags) (DEFAULT = 30)
lag	vector of lags used to compute Kauffman efficiency ratio (DEFAULT = 5). Re-cycled to be of equal length as fast and slow lags if necessary
keep.lambda	LOGICAL. If TRUE, adaptive smoothing factor lambda is returned as an attribute (DEFAULT = FALSE)
keep.ER	LOGICAL. If TRUE, adaptive Efficiency Ratio ER is returned as an attribute (DEFAULT = FALSE)
plot	LOGICAL. Return plot.
...	Further arguments to or from other methods.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

An object of class 'Movav' with attributes type = "KAMA", 'lambda' and 'ER' as required and 'fast.win', 'slow.win' and 'lag' given by the corresponding input parameters:

- matrix of size NROW(X) by NCOL(X)*length(fast.win) where each column is the moving average of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
kama(x, fast.win=5, slow.win=20, lag=10:20)

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
# compute moving average with single lag
kama(x, fast.win=5, slow.win=20, lag=10:20, plot=TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(1)
data(ex_fs)
# single lag
kama(ex_fs, fast.win=5, slow.win=20, lag=5, plot=TRUE)

## End (Not run)
```

kelt

Keltner channel

Description

Compute Keltner channel (Technical Analysis)

Usage

```
kelt(Close, High, Low, mult = 2, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
mult	mult
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

kri

Kairi Relative Index

Description

Compute Kairi Relative Index (Technical Analysis)

Usage

```
kri(X, lag1 = 10, lag2 = 20, plot = FALSE, ...)
```

Arguments

X	X
lag1	lag1
lag2	lag2
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

kurt skew

*Kurtosis and Skewness***Description**

kurt: Compute the excess kurtosis for each column of X

skew: Compute the skewness for each column of X

Usage

```
kurt(X, pval = FALSE)
```

```
skew(X, pval = FALSE)
```

Arguments

X Matrix of numeric data series (one column per variable).

pval LOGICAL. Return P-Value.

Value

Matrix of Excess Kurtosis / Skewness and P-Value

Author(s)

RAdamant Development Team <team@r-adamant.org>

kvo

*Klinger oscillator***Description**

Compute Klinger oscillator (Technical Analysis)

Usage

```
kvo(Close, High = NULL, Low = NULL,  
Vol = NULL, cumulative = FALSE, plot = TRUE, ...)
```

Arguments

Close VECTOR. Close price.

High VECTOR. High price.

Low VECTOR. Low price.

Vol VECTOR. Asset traded Volume.

cumulative cumulative

plot LOGICAL. If TRUE plot is returned.

... Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

lagret

*Time Series Operators***Description**

Ret: Compute N-points Returns on each column of the input matrix.

Lag: Compute lag on each column of the input matrix.

Diff: Compute lagged difference on each column of the input matrix.

MDiff: Compute Multiple lagged differences on each column of the input matrix. \ or MLag:

Compute Multiple lags on each column of the input matrix

Usage

```
Ret(X, lag = 1, log = FALSE, mode = "selected", na.rm = FALSE, plot = FALSE, ...)
```

```
Lag(X, lag = 1, na.rm = FALSE, padding = NA)
```

```
Diff(X, lag = 1, padding = NA, na.rm = FALSE)
```

```
MDiff(X, lag = 1, padding = NA,
mode = c("auto", "range", "selected"), na.rm = FALSE)
```

```
MLag(X, lag = 1, na.rm = FALSE, padding = NA,
mode = c("auto", "range", "selected"), autolag.start = 1)
```

Arguments

X	Input data (i.e. matrix/vector of prices)
lag	INTEGER or VECTOR. number of lags (it can be both positive and negative)
log	BOOLEAN: compute log-returns
na.rm	BOOLEAN: remove NAs
plot	BOOLEAN: return plot
padding	value to replace removed observations
mode	mode of using the vector of lags
autolag.start	autolag.start
...	Further arguments to or from other methods

Details

Sequences are treated as one-column matrices.

The parameter "mode" allows to control the calculation when the parameter is passed as a vector:

- auto: only the first element is used;
- range: if the lag arguments is composed of two numbers, the computation is performed for all the integers contained in the interval, ex: lag = c(4,10) allow to calculate all the lags between 4 and 10;
- selected: the computation is done only for the lag specified in the argument.

Value

A matrix (n.obs X n.lag) containing lagged /differenced time series or returns

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load an example dataset containing financial daily prices
data(ex_fs)
x = ex_fs[,1:4]

# compute multiple multiple lags for single time series
# different uses of the parameter "mode"
res = MLag(x[,1], lag = c(4,8), mode="range")
res[1:10, ]
res = MLag(x[,1], lag = c(4,8), mode="selected")
res[1:10, ]
res = MLag(x[,1], lag = 4, mode="auto")
res[1:10, ]

## SINGLE LAG
# calculate return for single time series
res = Ret(x[,1], lag=4, log=TRUE, na.rm=TRUE)
res[1:10, ,drop=FALSE]

# calculate return for multiple time series
res = Ret(x, lag=10, log=TRUE, na.rm=TRUE)
res[1:10, ,drop=FALSE]

## MULTIPLE LAGS
# calculate return for single time series
res = Ret(x[,1], lag=c(2,4,6,8), mode = "selected", log=TRUE, na.rm=TRUE)
res[1:10, ,drop=FALSE]

# calculate return for multiple time series
res = Ret(x[, 1:2], lag=c(2,4,6,8), mode = "selected", log=FALSE, na.rm=FALSE)
res[1:10, ,drop=FALSE]
```

```
## PLOT RESULTS
# calculation and plot for single series
Ret(x[,1], lag = 5, mode = "selected", plot=TRUE, style="bar", main="Returns - 5 Lags")

# calculation and plot for multiple series
par(mfrow=c(2,2))
Ret(x, lag = 5, mode = "selected", plot=TRUE, style="bar", main="Returns - 5 Lags")

## Not run:
# get APPLE financial series
symbol.lookup("Apple")
APPLE = get.fs("AAPL", from=as.Date("2008-06-01"), to=as.Date("2011-04-01"));
RAPPLE = Ret(APPLE, mode = "selected", plot = TRUE, style = "bar", ylab.fmt = .3, na.rm
RAPPLE;

## End(Not run)
```

lanczos

Lanczos window

Description

Computes Lanczos window of given length

Usage

```
lanczos(N, normalized = TRUE)
```

Arguments

N Window length.

normalized LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Lanczos window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## Not run:
# Generate a Normalised Lanczos window of size 100
x = lanczos(100)
# Plot the window
cplot(x
, main = "Lanczos Window"
, legend = attr(x, "type")
)
```

```
# Generate a non-normalised window
y = lanczos(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Lanczos Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)

## End(Not run)
```

lew

*Moving window***Description**

Apply a given function to an extending window of the lagged data series of the input matrix, each column separately.

Usage

```
lew(X, lag = 0, padding = NA, na.rm = FALSE,
func = NULL, is.cumulative = TRUE, ...)
```

Arguments

X	Input matrix/sequence
lag	vector of integer lags. If lag >= 0 data are shifted to the right, else to the left. (DEFAULT = 0)
padding	value used to initialise the output matrix (DEFAULT = NA)
na.rm	LOGICAL. If TRUE, N-lag entries are removed from the output (DEFAULT = FALSE)
func	function applied to the extending data window (DEFAULT = NULL)
is.cumulative	LOGICAL. If TRUE it the function provided must be cumulative by itself (like cummax, cummin, etc..) (DEFAULT = TRUE)
...	Additional parameters accepted by the function 'func'

Details

Sequences are treated as one-column matrices

Value

A matrix where func has been applied on increasing data windows for each column of X. Number of rows depends on the na.rm parameter. Number of columns is NCOL(X)

Author(s)

RAdamant Development Team <team@r-adamant.org>

liftgain

Classification model accuracy plots

Description

Plot cumulative Gain, Lift chart and ROC curve for a classification model

Usage

```
Gain(x, ...)
Lift(x, ...)
ROCplot(x, ...)
## S3 method for class 'scorecard'
Gain(x, pc = 0.1, ...)
## S3 method for class 'scorecard'
Lift(x, pc = 0.1, ...)
## S3 method for class 'scorecard'
ROCplot(x, ...)
```

Arguments

x	An object of class "scorecard"
pc	Numeric. A value indicating the perentile used to create data points.
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

ljbgarch

*Ljung-Box test***Description**

Perform Ljung-Box test for residual correlation

Usage

```
LjungBox(x, lags, plot.acf = FALSE)
```

Arguments

x	Residual series or object of class "Garch"
lags	Number of lags to calculate the autocorrelation function
plot.acf	LOGICAL. Plot ACF.

lkegarch

*EGARCH likelihood function***Description**

Calculate EGARCH likelihood function

Usage

```

like.egarch(theta, ee, x, Y,
order = c(alpha = 1, beta = 1), prob = c("norm", "ged", "t"))

```

Arguments

theta	theta
ee	ee
x	x
Y	Y
order	order
prob	prob

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

lkgarch

GARCH likelihood function

Description

Calculate GARCH likelihood function

Usage

```
like.garch(theta, ee, x, Y, order, prob = c("norm", "ged", "t"), r)
```

Arguments

theta	theta
ee	ee
x	x
Y	Y
order	order
prob	prob
r	r

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

lkmgarch	<i>MGARCH likelihood function</i>
----------	-----------------------------------

Description

Calculate MGARCH likelihood function

Usage

```
like.mgarch(theta, x, Y, order, prob=c("norm","ged","t"))
```

Arguments

theta	theta
x	x
Y	Y
order	order
prob	prob

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

lktgarch	<i>TGARCH likelihood function</i>
----------	-----------------------------------

Description

Calculate TGARCH likelihood function

Usage

```
like.tgarch(theta, ee, x, Y, order, prob = c("norm","ged", "t"))
```

Arguments

theta	theta
ee	ee
x	x
Y	Y
order	order
prob	prob

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

llv	<i>Lowest low</i>
-----	-------------------

Description

Compute Lowest low (Technical Analysis)

Usage

```
llv(X, lag, na.rm = TRUE)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
na.rm	na.rm

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

logger	<i>Main logging function</i>
--------	------------------------------

Description

Create Log for the functions contained in the package

Usage

```
Logger(message = "", from = deparse(sys.call(sys.parent())) ,  
level = 1, line = NA, env = getOption("RAdamant"),  
console = getConsoleLogging(env = env),  
logfile = getLogFile(env = env))
```

Arguments

message	Message printed.
from	from
level	Log depth level, minimum = 1
line	line
env	environment
console	console logging
logfile	log file

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

logit	<i>Logit transformation</i>
-------	-----------------------------

Description

Logit transformation

Usage

```
logit(x, adjust = 5e-05)
```

Arguments

x	x
adjust	adjust

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

 lrbtree

LR Binomial Tree

Description

Option evaluation with Leinsen and Reimer Binomial Tree

Usage

```
LR.BinTree(Nsteps, under, strike, rfr,
           sigma, maty, yield, life, ret.steps = FALSE)
```

Arguments

Nsteps	Nsteps
under	under
strike	strike
rfr	rfr
sigma	sigma
maty	maty
yield	yield
life	life
ret.steps	ret.steps

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

 macd

Moving Average Convergence / Divergence

Description

Compute Moving Average Convergence / Divergence (Technical Analysis)

Usage

```
macd(X, fast.lag = 12, slow.lag = 26, signal.lag = 14, plot = TRUE, ...)
```

Arguments

X	X
fast.lag	fast.lag
slow.lag	slow.lag
signal.lag	signal.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mass

Mass indicator

Description

Compute Mass indicator (Technical Analysis)

Usage

```
mass(High, Low, Close = NULL, lag = 9, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

masscum	<i>Mass indicator cumulative</i>
---------	----------------------------------

Description

Compute Mass indicator cumulative (Technical Analysis)

Usage

```
mass.cum(High, Low, Close = NULL, lag = 9, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mcf	<i>Auto-Correlation and Partial Auto-Correlation</i>
-----	--

Description

Compute auto-correlation and partial auto-correlation function on a matrix

Usage

```
mcf(X, lag.max = 10, ci = 0.95, plot=TRUE, ...)
```

Arguments

X	Matrix of data series (one column per variable)
lag.max	Max lag to be computed by the cross correlation function (DEFAULT: 10)
ci	Confidence Interval (DEFAULT: 0.95)
plot	LOGICAL. If TRUE, results are plotted.
...	additional parameters accepted by the function plot.cross.ccf.

Value

A list with two entries:

ACF	list of Auto-Correlation Functions (one for each column of X)
PACF	list of Partil Auto-Correlation Functions (one for each column of X)

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[cross.ccf](#)

Examples

```
## Not run:
# Plot Autocorrelation Function and Partial ACF
mcf(RSP, lag.max = 30)
# using another theme
theme = getTheme("Vanilla")
mcf(RDJ, lag.max = 30, theme = getTheme(2))

## End(Not run)
```

mcgind

McGinley Dynamic Indicator

Description

Compute McGinley Dynamic Indicator (Technical Analysis)

Usage

```
mcgind(X, lag = 12, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mclog

Manage Console Logging

Description

Set and retrieve the console logging status. Control whether logging info is printed to console.

Usage

```
setConsoleLogging(consoleLogging = TRUE, env = getOption("RAdamant"))
getConsoleLogging(env = getOption("RAdamant"))
```

Arguments

consoleLogging

LOGICAL. If TRUE, log information are also sent to console.

env

The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Value

Returns the current ConsoleLogging status.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current debug level
getConsoleLogging();

# Enable logging
setDebugTraceLevel(1);
setDebugLevel(1);
# Enable Console Logging
setConsoleLogging(TRUE);
cplot(1:10)
```

mcosc

McClellan Oscillator

Description

Compute McClellan Oscillator (Technical Analysis)

Usage

```
mcosc(X, fast.lag = 19, slow.lag = 39, hist.lag = 9, plot = TRUE, ...)
```

Arguments

X	X
fast.lag	fast.lag
slow.lag	slow.lag
hist.lag	hist.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mcplot

Multiple correlation plot

Description

Multiple correlation plot

Usage

```
mcplot(X, hist.nclass = 10, theme.params = getCurrentTheme(),
       coLin = TRUE,
       main = ifelse(coLin, "Co-Linearity Analysis", "Multi-Correlation Analysis"),
       new.device = FALSE, ...)
```

Arguments

X	X
hist.nclass	hist.nclass
theme.params	theme.params
coLin	coLin
main	main
new.device	new.device
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mcsi	<i>McClellan Summation Index</i>
------	----------------------------------

Description

Compute McClellan Summation Index (Technical Analysis)

Usage

```
mcsi(matr, nr, nc, lag1, lag2, plot = FALSE, ...)
```

Arguments

matr	matr
nr	nr
nc	nc
lag1	lag1
lag2	lag2
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mdbtlev	<i>Manage Debug Trace Level</i>
---------	---------------------------------

Description

Set and retrieve the level of function nesting for which logging is performed. Controls how much information is sent to the log about the execution of each function executed inside the call stack.

Usage

```
setDebugTraceLevel(level = 1, env = getOption("RAdamant"))
getDebugTraceLevel(env = getOption("RAdamant"))
```

Arguments

level	The level of nesting (level >= 1). See details.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Details

The amount of information sent to log depends on the debug trace level:

- level = 1: Only top level function calls are logged.
- level = 2: Top and second level function calls (function within a function) are logged.
- level = N: All functions in the call stack up to level N are logged.

Value

The current value of debug trace level.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current debug level
getDebugTraceLevel();

# Enable logging to console
setConsoleLogging(TRUE);

# Set minimal level of trace debugging
setDebugTraceLevel(1);
cplot(1:10);

# Set high level of trace debugging (up the 10th level of inner function call)
setDebugTraceLevel(5);
cplot(1:10);
```

mdebuglev

Manage Debug Level

Description

Set and retrieve the level of debugging. Control how much information is sent to the log about the execution of each function executed.

Usage

```
setDebugLevel(level = 1, env = getOption("RAdamant"))
getDebugLevel(env = getOption("RAdamant"))
```

Arguments

level	The level of debug required (level >= 0). See details.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Details

The amount of information sent to log depends on the debug level:

- level = 0: No information is sent to the log.
- level = 1: Information about main body and conditional executions.
- level = 2: Include information about first level inner loop.
- level = 3: Include information about second level inner loop (loop within loop).
- level = N: Include information about N-th level inner loop.

Value

The current level of debugging.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current debug level
getDebugLevel();

# Set minimal level of debugging and traceback
setDebugLevel(1);
setDebugTraceLevel(1);
# Enable Console logging
setConsoleLogging(TRUE);

# Compute FFT on some random two-columns matrix. Prints nothing because FFT.default has no
x = FFT(matrix(cumsum(rnorm(256)), 128, 2), plot = FALSE)
plot(x, shaded = FALSE) # Prints nothing because plot.default has no logging message

# Increase Traceback level
setDebugTraceLevel(2);
# Now prints logging info for plot.FFT
plot(x, shaded = FALSE)

# Increase Debug level
setDebugLevel(2);
# Now prints additional logging info for plot.FFT (from code executed inside a loop)
plot(x, shaded = FALSE)
```

means

Geometric and Harmonic means

Description

gmean: Compute the geometric mean for each column of X
hmean: Compute the harmonic mean for each column of X

Usage

```
gmean(X, ...)  
hmean(X, ...)
```

Arguments

`X` Matrix of data series (one column per variable)
`...` Additional parameters accepted by the function `sum` (i.e. `na.rm`)

Value

Matrix of harmonic / geometric means

Author(s)

RAdamant Development Team <team@r-adamant.org>

mfind	<i>Money flow indicator</i>
-------	-----------------------------

Description

Compute Money flow indicator (Technical Analysis)

Usage

```
Mflow.ind(Close, High, Low, Volume, plot = FALSE, ...)
```

Arguments

`Close` VECTOR. Close price.
`High` VECTOR. High price.
`Low` VECTOR. Low price.
`Volume` VECTOR. Asset traded Volume.
`plot` LOGICAL. If TRUE plot is returned.
`...` Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mflow	<i>Money flow</i>
-------	-------------------

Description

Compute Money flow (Technical Analysis)

Usage

```
Mflow(Close, High, Low, Volume, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Volume	VECTOR. Asset traded Volume.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mfratio	<i>Money flow ratio</i>
---------	-------------------------

Description

Compute Money flow ratio (Technical Analysis)

Usage

```
Mflow.ratio(Close, High, Low, Volume, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Volume	VECTOR. Asset traded Volume.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

minmaxs	<i>Mini/Max Scale</i>
---------	-----------------------

Description

Compute minimum / maximum scale of a vector

Usage

```
Minmaxscal(x, tmin = 0, tmax = 1)
```

Arguments

x	x
tmin	tmin
tmax	tmax

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

mlbsize	<i>Manage Log Buffer Size</i>
---------	-------------------------------

Description

Set and retrieve the size of the current log buffer.

Usage

```
setLogBufferSize(size = 10000, env = getOption("RAdamant"), ...)
getLogBufferSize(env = getOption("RAdamant"))
```

Arguments

size	The capacity (number of records) of the log buffer.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).
...	Additional parameters passed to flushLogBuffer.

Value

Returns the size of the current log buffer.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current buffer size
getLogBufferSize();

# Set the size of the log buffer to 10 records (this will force a flush to file of the cu
setLogBufferSize(10);
```

mlogfile

Manage Logging Filename

Description

Set and retrieve the full filename and location of the current log file.

Usage

```
setLogFile(logfile = NULL, env = getOption("RAdamant"))
getLogFile(env = getOption("RAdamant"))
```

Arguments

logfile	String. The full path to the log file.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Value

The full filename and location of the current log file.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current log file
getLogFile();

# Set log file
setLogFile("path-to-logfile");
```

mlogwarn	<i>Manage log warnings</i>
----------	----------------------------

Description

Set and retrieve the LogWarning status. Not all functions support this feature.

Usage

```
setLogWarning(showWarning = TRUE, env = getOption("RAdamant"))
getLogWarning(env = getOption("RAdamant"))
```

Arguments

showWarning	LOGICAL. If TRUE, a warning is generated if the log buffer is full and no logfile is available.
env	The environment where the info is stored (DEFAULT = getOption("RAdamant")).

Value

The current value of LogWarning (TRUE/FALSE).

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Retrieve current status
getLogWarning();

# Set the size of the log buffer to 10 records
setLogBufferSize(10);
# Set an invalid entry for the log file
setLogFile(logfile = NULL);

# Enable logging
setDebugLevel(1)
# Enable Log Warning
setLogWarning(TRUE);
# Prints a warning
cplot(1:10)

# Disable Log Warning
setLogWarning(FALSE);
# No warning
cplot(1:10)

# Restore RAdamant package options
# .First.lib()
```

mma

*Modified EMA***Description**

Compute multiple Modified EMA on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
mma(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by function <code>ema</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
MMA is a EMA with smoothing factor: $\lambda = 1/\text{win.size}$.

Value

A object of class 'ma' with attributes `type = "MMA"` and 'win.size' as given by the corresponding input parameter:
- matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) \times \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
mma(x, 15)
# compute moving average with multiple lags
mma(x, c(5, 10, 30, 50))
```

```
## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
mma(x, 30, plot = TRUE)
# multiple lags
mma(x, c(5, 10, 30, 50), plot=TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
mma(ex_fs, c(5, 10, 30, 50), plot=TRUE)

## End(Not run)
```

mndma

Modified N-Day Moving Averages

Description

Computes multiple Modified N-Day Moving Averages on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
mndma(X, win.size = 50, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable)
<code>win.size</code>	Vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by the function <code>sma</code>

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'Movav' with attributes `type = "MNDMA"` and `'win.size'` as from the corresponding input parameter:
 - matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) \times \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

```

mom	<i>Momentum oscillator</i>
-----	----------------------------

Description

Compute Momentum oscillator (Technical Analysis)

Usage

```
mom(X, lag = 5, plot = TRUE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

moments	<i>Main Moments</i>
---------	---------------------

Description

Calculate sample moments on each columns of *X*

Usage

```
moments(X)
```

Arguments

X Matrix of data series (one column per variable)

Value

Matrix of moments

Author(s)

RAdamant Development Team <team@r-adamant.org>

movapply	<i>Moving Apply function</i>
----------	------------------------------

Description

Applies a given function to a sliding window of the input data

Usage

```
movApply(X, win.size = 1, padding = NA, rm.transient = FALSE, func = NULL, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of data window sizes that will be passed to the given function "func" (DEFAULT = 1).
<code>padding</code>	Padding value to fill transient of result (output data rows from 1 to win.size-1). (DEFAULT = NA)
<code>rm.transient</code>	transient: LOGICAL. If TRUE, transient is removed, otherwise func is applied to the transient. (DEFAULT = FALSE)
<code>func</code>	Function to be run
<code>...</code>	Additional parameters accepted by the function func

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A matrix of size `NROW(X)` by `NCOL(X)*length(win.size)`. func is applied to each sliding window `SWi` (given by `win.size[i]`) and each column of `X`.

Author(s)

RAdamant Development Team <team@r-adamant.org>

 movav

Generic Multiple) Moving Average

Description

Generic Multiple Moving Average (MA filter). Compute multiple FIR filtering on each column of the input data

Usage

```
Movav(X, ...)
## Default S3 method:
Movav(X, win.size = NULL,
      func = NULL, padding = 0,
      rm.transient = TRUE, normalize.weights = FALSE,
      type = "MA", desc = "Moving Average",
      plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of lengths of the FIR filters to be applied on the data <code>X</code> . (DEFAULT = NULL).
<code>func</code>	function accepting an integer <code>N</code> and returning an <code>N</code> -long set of filter coefficients.
<code>padding</code>	value to replace leading lagged values.
<code>rm.transient</code>	remove initial lagged window.
<code>normalize.weights</code>	Normalise weights for weighted moving averages.
<code>type</code>	Character attribute attached to the result (DEFAULT: "MA").
<code>desc</code>	desc
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Further arguments to or from other methods

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'Movav' with attributes 'type' and 'win.size' as given by the corresponding input parameters:

- matrix of size `NROW(X)` by `NCOL(X)*length(win.size)` where each column is the moving average of length `win.size[i]` of the corresponding column of `X`.

Author(s)

RAdamant Development Team <team@r-adamant.org>

movfunc

Moving Base Functions

Description

Applies the function "Max", "Min", "Standard Deviation" or "Variance" to a sliding window of the input data

Usage

```
movMax(X, win.size = 1, ...)
movMin(X, win.size = 1, ...)
movSd(X, win.size = 1, ...)
movVar(X, win.size = 1, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	Vector of data window sizes that will be used for the calculations (DEFAULT = 1).
<code>...</code>	Additional parameters accepted by the function <code>movApply</code>

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A matrix of size NROW(X) by NCOL(X)*length(win.size). max is applied to each sliding window SWi (given by win.size[i]) and

Author(s)

RAdamant Development Team <team@r-adamant.org>

mqt

Multiple t quantile

Description

Compute quantiles from Students T distribution for multiple degrees of freedom values

Usage

```
mqt(p, df, ...)
```

Arguments

p	Vector of probabilities (DEFAULT = 0.05)
df	Vector of degrees of freedom
...	Further arguments to and from other methods

Value

A matrix length(p) by length(df) of computed quantiles

Author(s)

RAdamant Development Team <team@r-adamant.org>

`mreg`*Multiple regressions*

Description

Multiple regressions

Usage

```
mreg(Y, X, xlabels = NULL, tick.step = 1, backtest = 0,
      stress.idx = c(), type = "simple",
      model = "lm", ci = 0.95, max.vars = NCOL(X),
      intercept = TRUE, family = gaussian, weights = NULL,
      plot = TRUE, scope = NULL, trace = FALSE, ...)
```

Arguments

<code>Y</code>	<code>Y</code>
<code>X</code>	<code>X</code>
<code>xlabels</code>	<code>xlabels</code>
<code>tick.step</code>	<code>tisck.step</code>
<code>backtest</code>	<code>backtest</code>
<code>stress.idx</code>	<code>stress.idx</code>
<code>type</code>	<code>type</code>
<code>model</code>	<code>model</code>
<code>ci</code>	<code>ci</code>
<code>max.vars</code>	<code>max.vars</code>
<code>intercept</code>	<code>intercepts</code>
<code>family</code>	<code>family</code>
<code>weights</code>	<code>weights</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>trace</code>	<code>trace</code>
<code>scope</code>	<code>scope</code>
<code>...</code>	Further arguments to or from other methods

msort

*Sort matrix***Description**

Sort each column of the input matrix X independently

Usage

```
SORT(X, decreasing = FALSE, ...)
```

Arguments

X	Input matrix.
decreasing	LOGICAL. Decreasing order.
...	Further arguments to or from other methods.

Value

A matrix with the same dimensions as the original input X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
data(ex_fs)
x = ex_fs[1:20, 1:3]
SORT(x, decreasing = FALSE)
```

*Cool.Acf methods***Description**

Plot and Print methods for class 'cool.acf'

Usage

```
## S3 method for class 'cool.acf'
print(x, ...)
## S3 method for class 'cool.acf'
plot(x, theme.params = getCurrentTheme(), xtitle = "Lag", ytitle =
expression(rho), overrides = list(...), ...)
```

Arguments

<code>x</code>	Instance of class 'cool.acf'
<code>theme.params</code>	Theme parameters (DEFAULT: <code>getCurrentTheme()</code>)
<code>xtitle</code>	Title for the x-axis (DEFAULT: "Lag")
<code>ytitle</code>	Title for the y-axis (DEFAULT: <code>expression(rho)</code>)
<code>overrides</code>	List of parameters to override the theme. Must match by name the parameters defined by the theme (DEFAULT: NULL)
<code>...</code>	Further arguments to or from other methods

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

mtccf

Cross.ccf functions

Description

Methods for class 'cross.ccf'

Usage

```
## S3 method for class 'cross.ccf'
print(x, ...)
## S3 method for class 'cross.ccf'
plot(x, theme.params = getCurrentTheme(), xtitle = "Lag", ytitle =
expression(rho), overrides = list(...), ...)
```

Arguments

<code>x</code>	Instance of class 'cross.ccf'
<code>theme.params</code>	Theme parameters (DEFAULT: <code>getCurrentTheme()</code>)
<code>xtitle</code>	Title for the x-axis (DEFAULT: "Lag")
<code>ytitle</code>	Title for the y-axis (DEFAULT: <code>expression(rho)</code>)
<code>overrides</code>	List of parameters to override the theme. Must match by name the parameters defined by the theme (DEFAULT: NULL)
<code>...</code>	Further arguments to or from other methods

Value

Void

Author(s)

namutil

Get column and row names

Description

Retrieve column / row names from a matrix.

Usage

```
get.col.names(X, default = "X")
get.row.names(X, default = "")
```

Arguments

X	Input matrix.
default	LOGICAL vector. Each entry determines the sort direction of the respective column of X. Recycled if necessary. (DEFAULT = FALSE).

Details

Sequences are treated as one column matrices.
 Default names are given if input has missing names.

Value

A character sequence containing the column names of X, or a default set of names if X has no column names

Author(s)

RAdamant Development Team <team@r-adamant.org>

newsimp

News impact curve

Description

Compute News impact curve

Usage

```
newsimp(x, ...)
## S3 method for class 'Garch'
newsimp(x, plot = TRUE, ...)
## Default S3 method:
newsimp(x, theta, order,
type=c("garch", "mgarch", "egarch", "tgarch"),
plot=FALSE, ...)
```

Arguments

x	x
theta	theta
order	order
type	type
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods

Note

plotfft

Customised Fast Fourier Transform - Plotting

Description

Plot function for class 'FFT'. Plots Modulus and Phase for each column of the FFT object x

Usage

```
## S3 method for class 'FFT'
plot(x
, theme.params = getCurrentTheme()
, overrides = list(...)
, shaded = TRUE
, show.periodicity = FALSE
, show.legend = FALSE
, zoom = 100
, semilog = FALSE
, new.device = FALSE
, ...
)
```

Arguments

<code>x</code>	Instance of class 'FFT'.
<code>theme.params</code>	theme parameters list (DEFAULT: <code>getCurrentTheme()</code>).
<code>overrides</code>	List of parameters to override the theme. Only parameters that match those defined by the theme are overridden (DEFAULT: <code>list(...)</code>).
<code>shaded</code>	LOGICAL. If TRUE, the modulus of <code>x</code> is shaded.
<code>show.periodicity</code>	LOGICAL. If TRUE, Periods (1/frequencies) are showed instead of frequencies on the x-axis (DEFAULT = FALSE).
<code>show.legend</code>	LOGICAL. If TRUE, legend is added to the plot (DEFAULT = FALSE)
<code>zoom</code>	Zoom
<code>semilog</code>	Semilog
<code>new.device</code>	<code>new.device</code>

```
# Load sample financial series data
data(ex_fs)

# Frequency Analysis
```

```

Xf = FFT(ex_fs, plot = FALSE)

# Plot full spectrum
plot(Xf)

# Plot half spectrum (right side) and use blackman windowing, remove area shading
plot(Xf, half = TRUE, window = blackman, shaded = FALSE)

# Show periodicity instead of frequency, and use hamming window
plot(Xf, half = TRUE, window = hamming, show.periodicity = TRUE)

# Use kaiser window, zoom in to show only 10% of the half frequency spectrum, use semilog
plot(Xf, half = TRUE, window = kaiser, show.periodicity = TRUE, zoom = 10, semilog = TRUE)

```

plotfs

Plot fs data

Description

Plot method for Financial Series (fs) object.

Usage

```
## S3 method for class 'fs'
plot(x, ...)
```

Arguments

x	Instance of class 'fs'
...	Additional parameters passed to <code>fin.plot</code> function.

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[fin.plot.](#)

Examples

```

# Load sample financial series data
data(ex_fs)
# Plot the data
plot(ex_fs)
# Change the style and color of the bottom chart
plot(ex_fs, overrides2 = list(type = "l", col = "grey"))

```

Description

Utilities functions used for Plotting

Usage

```
draw.grid(X, base = NULL, theme.params = getCurrentTheme())

draw.legend(legend = "", theme.params = getCurrentTheme(),
  overrides = list(...), ...)

draw.projections(X, Y, Y.fit,
  col = getCurrentTheme()[["projection.col"]][1],
  type = getCurrentTheme()[["projection.type"]][1],
  lty = getCurrentTheme()[["projection.lty"]][1])

draw.x.axis(X, base = NULL, xlabels = NULL,
  theme.params = getCurrentTheme(), show.labels = TRUE, ...)

draw.x.title(xtitle = "", theme.params = getCurrentTheme())

draw.y.axis(X, ylabels = NULL, theme.params = getCurrentTheme(),
  side = 1, show.labels = TRUE, ...)

draw.y.title(ytitle = "", theme.params = getCurrentTheme(), side = 1)
```

Arguments

X	X
Y	Y
base	base
theme.params	theme.params
overrides	overrides
legend	legend
xlabels	xlabels
ylabels	ylabels
xtitle	xtitle
ytitle	ytitle
show.labels	show.labels
Y.fit	Y.fit
col	col
type	type
lty	lty
side	side
...	Further arguments to or from other methods.

plotmov	<i>Plot Moving Average</i>
---------	----------------------------

Description

Plot method for object of class 'Movav' (Moving Average)

Usage

```
## S3 method for class 'Movav'
plot(x, fs = NULL, main = attr(x, "desc"), ...)
```

Arguments

x	instance of class 'Movav'
fs	Matrix containing the original data series (one column per variable). For financial time series (class = 'fs'), only 'Close' column is processed.
main	Main title of the plot
...	Additional parameters accepted by the functions cplot and fin.plot

Details

If the original data series is an instance of class 'fs', then the plot will have two panels:

- plot of fs and x on the top;
- histogram of the Volume data of the financial series X.

Value

VOID

plotspec

*Spectrogram Plotting***Description**

Plot method for class 'specgram'.

Usage

```
## S3 method for class 'specgram'
plot(x
, show.periodicity = FALSE
, theme.params = getCurrentTheme()
, xtitle = "Time"
, ytitle = ifelse(show.periodicity, "Periodicity", "Frequency")
, plot3d = FALSE
, overrides = list(...)
, ...
)
```

Arguments

<code>x</code>	Instance of class 'specgram'
<code>show.periodicity</code>	LOGICAL. If TRUE, Periods (1/frequencies) are showed instead of frequencies on the x-axis (DEFAULT = FALSE)
<code>theme.params</code>	theme parameters (DEFAULT = <code>getCurrentTheme()</code>)
<code>xtitle</code>	Title for the x-axis (DEFAULT = "Time")
<code>ytitle</code>	Title for the y-axis (DEFAULT = "Frequency" or "Periodicity" depending on the value of <code>show.periodicity</code>)
<code>plot3d</code>	LOGICAL. If TRUE, 3D spectrogram is plotted.
<code>overrides</code>	list of parameters to override the theme. Only parameters that match those defined by the theme are overridden (DEFAULT = <code>list(...)</code>)
<code>...</code>	Used to quickly specify theme overrides.v

prbsar	<i>Parabolic Stop and Reverse (PSAR)</i>
--------	--

Description

Compute Parabolic Stop and Reverse (PSAR) (Technical Analysis)

Usage

```
prbsar(Close, High, Low, accel = c(0.02, 0.2), plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
accel	accel
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

preder	<i>Prediction error</i>
--------	-------------------------

Description

Measures for model evaluation

Usage

```
pred_error(target, pred, pc = FALSE)
av_er(target, pred, pc=FALSE)
abs_avdi(target, pred, pc=FALSE)
mse(target, pred)
sde(target, pred)
track_sign(target, pred)
track_sign_exp(target, pred)
```

Arguments

target	VECTOR. Observed target value
pred	VECTOR. Predicted values
pc	Logical. If TRUE return results in percentage

Details

- pred_error: Prediction error
- av_er: Average error
- abs_avdi: Absolute average discard
- mse: Mean squared error
- sde: Error standard deviation
- track_sign: Error track signal
- track_sign_exp: Exponential track signal

Author(s)

RAdamant Development Team <team@r-adamant.org>

predgar	<i>Predict Garch model</i>
---------	----------------------------

Description

Predict Garch model

Usage

```
## S3 method for class 'Garch'
predict(object, plot = TRUE, ...)
```

Arguments

object	OBJECT of class "Garch".
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

predmreg

Predict method for Multiple regressions

Description

Predict function for class 'mreg'

Usage

```
## S3 method for class 'mreg'
predict(object, ...)
```

Arguments

`object` OBJECT of class "mreg".
`...` Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

predreg

Predict method for regression

Description

Predict method for class 'reg'

Usage

```
## S3 method for class 'reg'
predict(object, newdata = NULL, ci = 0.95, mode = c("response", "link"),
plot = FALSE, shaded = FALSE, xlabels = NULL, main = "Linear Model Prediction",
getThemeAttr("col", exact = TRUE)[c(1, 2, 2)],
shade.stripes = 1, shade.col = getThemeAttr("col", exact = TRUE)[2],
shade.density = 40, shade.angle = 30, legend = NULL, ...)
```

Arguments

object	OBJECT of class "reg".
newdata	newdata
ci	ci
mode	mode
plot	LOGICAL. If TRUE plot is returned.
shaded	shaded
xlabels	xlabels
main	main
col	color
shade.stripes	shade.stripes
shade.col	shade.col
shade.density	shade.density
shade.angle	shade.angle
legend	legend
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

predvear	<i>VAR predictions</i>
----------	------------------------

Description

Predict VAR model

Usage

```
## S3 method for class 'VecAr'
predict(object, steps = 5, CI = 0.95, viewby = c("vars", "step"), ...)
```

Arguments

object	OBJECT of class "VecAr".
steps	steps
CI	CI
viewby	viewby
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

printfft

Print FFT results

Description

Print method for class 'FFT'

Usage

```
## S3 method for class 'FFT'
print(x, ...)
```

Arguments

x	Instance of class 'FFT'
...	Further arguments to and from other methods

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

printfs

Print fs data

Description

Print method for Financial Series (fs) object.

Usage

```
## S3 method for class 'fs'
print(x, ...)
```

Arguments

x	Instance of class 'fs'
...	Not Used. For compatibility with the generics print function.

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

printvar	<i>Print VaR results</i>
----------	--------------------------

Description

Print method for class 'VaR'

Usage

```
## S3 method for class 'VaR'
print(x, ...)
```

Arguments

x	Instance of class 'VaR'
...	Further arguments to and from other methods

Value

Void

Author(s)

RAdamant Development Team <team@r-adamant.org>

pro	<i>Price oscillator</i>
-----	-------------------------

Description

Compute Price oscillator (Technical Analysis)

Usage

```
pro(Close, fast.lag = 5, slow.lag = 10, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
fast.lag	fast.lag
slow.lag	slow.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

probit

Probability of first hit (Brownian motion)

Description

Calcualte probability to Hit a barrier

Usage

```
ProbHit(B = 0, S0 = 0, mi, sigma)
```

Arguments

B	B
S0	S0
mi	mi
sigma	sigma

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

psme

Print Sample Mean Excess class

Description

Printing function for Sample Mean Excess class

Usage

```
## S3 method for class 'sme'
print(x, ...)
```

Arguments

x	OBJECT of class "sme".
...	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

ptfoper

Portfolio operators

Description

Get portfolio Beta

Usage

```
PtfRet(PTF, w = NULL, glob = TRUE, calc.ret = FALSE, ...)
```

```
PtfVar(PTF, w = NULL, glob = TRUE,
vol = FALSE, calc.ret = FALSE, ...)
```

```
PtfBeta(beta, w = NULL, glob = TRUE)
```

Arguments

PTF	Matrix containing one or more series of prices/returns, one time series for each asset
w	Vector of portfolio weights
glob	Logical. If TRUE return the value for the whole portfolio.
vol	Logical. If TRUE returns volatility (standard deviation instead of variance).
calc.ret	Logical. If TRUE the input matrix is considered as a matrix of prices, so returns are calculated.
beta	Value of the Beta coefficient or an object of class "Capm".
...	Further arguments to or from other methods.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example portfolio
data(ex_ptf)
# results for each series
PtfRet(ex_ptf, glob=FALSE)
PtfVar(ex_ptf, glob=FALSE)
# results for the whole portfolio
PtfRet(ex_ptf, glob=TRUE)
PtfVar(ex_ptf, glob=TRUE)
```

```
# Example with a series of prices instead of returns
data(EuStockMarkets)
PtfRet(PTF = EuStockMarkets, w=c(0.3, 0.4, 0.2, 0.1), calc.ret=TRUE)
PtfRet(PTF = EuStockMarkets, w=c(0.3, 0.4, 0.2, 0.1), glob = FALSE, calc.ret=TRUE)
```

ptfopt

Mean-Variance optimum portfolio

Description

Calculate mean-variance efficient portfolio

Usage

```
PtfOpt(ret = NULL, ptf = NULL, mi = NULL, SIGMA = NULL, volatility = TRUE, ...)
## S3 method for class 'PtfOpt'
print(x, ...)
```

Arguments

ret	Vector containing average return for each asset
ptf	Matrix containing one or more series of prices, one time series for each asset
mi	Target return for the portfolio
SIGMA	Sample covariance matrix
volatility	Logical. If TRUE volatility is returned, else the variance is computed.
x	An object of class "PrfOpt".
...	Further arguments to or from other methods

radpkg

*Financial Technical Analysis and Risk Management***Description**

R-Adamant is a collection of functions and algorithms for processing of Financial Time Series, Risk Management and Econometrics.

Details

Package: RAdamant
 Type: Package
 Version: 0.8.1
 Date: 2011-07-11
 License: GPL>=2
 LazyLoad: yes

Author(s)

RAdamant Development Team Maintainer: RAdamant Development Team <team@r-adamant.org>

recref

*Recode and Reformat***Description**

Change the attributes and format of vector or data frame

Usage

```
recode(x, old, new)
reformat(X, classes)
```

Arguments

x	Vector input.
X	Matrix or Data frame input
old	Old (actual) unique values in the vector
new	New values to be placed in the vector
classes	Vector containing the classes to be applied to X. The vector must contain one class for each column of the input X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# create random numeric vector
old_vec = sample(c(1,2,3), 10, TRUE)
# old values
old = unique(old_vec)
# new values
new = c("low", "medium", "high")
# new vector
new_vec = recode(old_vec, old=old, new=new)
```

recycle

*Recycle function for time series***Description**

Recycle an input sequence X to get a new sequence of the specified length V

Usage

```
recycle(X, V = length(X))
```

Arguments

X	X
V	V

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

relvol

*Relative Volatility oscillator***Description**

Compute Relative Volatility oscillator (Technical Analysis)

Usage

```
RelVol(Close, sdlag = 9, lag = 5)
```

Arguments

Close	VECTOR. Close price.
sdlag	sdlag
lag	INTEGER. Number of lag periods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

rema	<i>Regularised Exponential Moving Averages</i>
------	--

Description

Compute multiple Regularised Exponential Moving Averages on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
rema(X, win.size = NROW(X), alpha = 0.5, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
<code>alpha</code>	weight in the interval $[0, 1]$. (DEFAULT: 0.7).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters for future development.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
 REMA is a second order IIR filter with the two coefficients are regulated by the smoothing factors λ and α .
 Smoothing factors: $\lambda = 2/(\text{win.size}+1)$ and α .

Value

A object of class 'ma' with attributes type = "REMA", ' λ ' and ' α ':
 - matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) \times \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

Author(s)

```

rgev

Generalised Extreme Value (GEV) - Random Numbers Generator

Description

Generalised Extreme Value (GEV) - Random Numbers Generator

Usage

```
rgev(N, mu = 0, xi = 0.1, sigma = 1)
```

Arguments

N	N
mu	mu
xi	xi
sigma	sigma

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

`rgpd`*Generalised Pareto Distribution (GPD) - Random Numbers Generator*

Description

Generalised Pareto Distribution (GPD) - Random Numbers Generator

Usage

```
rgpd(n, xi = 0.1, sigma = 1, trsh = 0)
```

Arguments

<code>n</code>	<code>n</code>
<code>xi</code>	<code>xi</code>
<code>sigma</code>	<code>sigma</code>
<code>trsh</code>	<code>trsh</code>

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

`roc`*Rate of Change index*

Description

Compute Rate of Change index (Technical Analysis)

Usage

```
roc(X, lag = 5, pc = TRUE, plot = TRUE, ...)
```

Arguments

<code>X</code>	<code>X</code>
<code>lag</code>	INTEGER. Number of lag periods.
<code>pc</code>	<code>pc</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

rowmax

Maximum / Minimum by row

Description

rowMax: Compute parallel max across the rows of X

rowMin: Compute parallel min across the rows of X

Usage

```
rowMax(X)
```

```
rowMin(X)
```

Arguments

X Input matrix/sequence

Value

A matrix NROW(X) by one, where each row is the max / min of the rows of X).

Author(s)

RAdamant Development Team <team@r-adamant.org>

rschint

Interval for uniroot function

Description

Compute a proper search interval for uniroot function

Usage

```
root.search.interval(from, func = NULL,
  type = c("left", "both", "right"), max.iter = 500,
  show.warnings = FALSE, debug = FALSE, ...)
```

Arguments

from from

func func

type type

max.iter max.iter

show.warnings show.warnings

debug debug

... Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

rsi	<i>Relative strength indicator</i>
-----	------------------------------------

Description

Compute Relative strength indicator (Technical Analysis)

Usage

```
rsi(X, lag, plot = FALSE, ...)
```

Arguments

x	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

runlog	<i>Error Handling and Log with runner</i>
--------	---

Description

write.log: Simple function to write/append log to file (csv format).
error.handling: Error handling function

Usage

```
write.log(log = matrix(NA, nrow = 0, ncol = 0), logfile = "runlog.log")  
error.handling(err)
```

Arguments

<code>log</code>	Matrix containing logging information.
<code>logfile</code>	Filename of the log
<code>err</code>	List containing the status code of the error.

Details

Function `error.handling` is to be called ONLY inside a `tryCatch` statement.

It assigns three variables:

- `log.status` = "Failed": the status of the execution is set to "Failed"
- `log.message`: The error message generated inside the `tryCatch`
- `res` = NA: the result is set to NA

Value

VOID

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[run](#), [multirun](#)

runner

Runner and Multirunner

Description

Wrapper function to execute any function.

Run single or multiple functions and provide a list of results.

Usage

```
run(func = NULL, args = list(), writelog = TRUE,
    logfile = "runlog.log", check.input = TRUE,
    output = c("console", "sing.file"))
```

```
multirun(func.array = character(0), args.list = list(),
    writelog = TRUE, logfile = "runlog.log",
    output = c("console", "sing.file", "multi.file"))
```

Arguments

<code>func</code>	Name of the function to run
<code>func.array</code>	Array of function names to execute
<code>args</code>	Named list of parameters of the function. Each entry is of the form: <code>args[["PARAM.NAME"]] = VALUE</code> .

<code>args.list</code>	Array of named list of parameters of the function. Each entry is a list of parameters, as required by the wrapper function "run".
<code>writelog</code>	LOGICAL. If TRUE, execution log is written to file.
<code>logfile</code>	Filename of the log
<code>check.input</code>	LOGICAL. If TRUE, basic checks are performed on input data, and stop code execution in case of wrong data.
<code>output</code>	Choose whether to return the results in the console or export them to text file.

Details

When called the function `multirun` the elements of the argument `args.list` can be specified with or without names. If the names are specified the arguments can be put in a different order from the array function.

If `writelog = TRUE` a log containing information about submitted computation is saved in the current working directory. If `output = "sing.file"`, a text file containing all the results is saved in current working directory.

The file will be named "Run_time_date.txt" If `output = "sing.file"`, a text for each called function is saved in a text file.

The files will be named "Function Name_time_date.txt"

Value

The object returned depends on the function being called.

`multirun` returns a list of results, one entry for each function being executed.

Author(s)

RAdamant Development Team <team@r-adamant.org>

, writelog = TRUE
)
# Specifies names in the list of arguments
multirun(func.array=c("ema", "sma")
, args.list=list( sma=list(rnorm(150), 5), ema=list(rnorm(100), 30) )
, TRUE
)
# Output to text file
multirun(func.array=c("ema", "sma")
, args.list=list( sma=list(rnorm(150), 5), ema=list(rnorm(100), 30) )
, output = "multi.file"
)
```

rvi	<i>Relative Vigor indicator</i>
-----	---------------------------------

Description

Compute Relative Vigor indicator (Technical Analysis)

Usage

```
rvi(Close, High = NULL, Low = NULL, Open = NULL, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
Open	VECTOR. Open price.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

sampmom	<i>Sample moments (Brownian motion)</i>
---------	---

Description

Calculate sample moments of a Brownian motion

Usage

```
SampMom(P, X, moms = 1:2)
```

Arguments

P	P
X	X
moms	moms

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

scaledf

Apply functions on a scaled window

Description

scalApply: Applies a given function to the pairs (X[n, i], X[n-lag, i]).

scalMax: Scaled max on each column of the input matrix. scalMin: Scaled min on each column of the input matrix

Usage

```
scalApply(X, lag = 0, padding = NA, na.rm = FALSE, func = NULL, ...)
scalMax(X, lag = 1, padding = -Inf, na.rm = FALSE, func = NULL)
scalMin(X, lag = 1, padding = Inf, na.rm = FALSE, func = NULL)
```

Arguments

X	Input matrix/sequence
lag	vector of integer lags. If lag >= 0 data are shifted to the right, else to the left. (DEFAULT = 0)
padding	value used to initialise the output matrix (DEFAULT = NA)
na.rm	LOGICAL. If TRUE, N-lag entries are removed from the output (DEFAULT = FALSE)
func	function applied to the data (DEFAULT = NULL)
...	Additional parameters accepted by the function 'func'

Details

Sequences are treated as one-column matrices.

Value

A matrix where func / max / min has been applied on each pair (X[n, i], X[n-lag, i]) for each column i of X. Number of rows depends on the na.rm parameter. Number of columns is NCOL(X)

Author(s)

RAdamant Development Team <team@r-adamant.org>

scorecd

*Score Card***Description**

Create Credit Score Card based on Logistic Regression

Usage

```
Score.card(X, Y, nseg = 2, col.classes=NULL)

## S3 method for class 'scorecard'
print(x, ...)

## S3 method for class 'scorecard'
summary(object, plot=FALSE, ...)
## S3 method for class 'scorecard'
predict(object, ...)
```

Arguments

X	DATA.FRAME / MATRIX of regressors.
Y	VECTOR. Target variable in 0-1 format.
nseg	INTEGER / VECTOR. Number of segments to factorise numerical variables.
col.classes	Vector. Indicate the format to use for each variable (Numeric / Character). If NULL the original input formats are maintained.
x, object	an object of class "scorecard"
plot	Logical. If TRUE accuracy plots are displayed: <ul style="list-style-type: none"> • Lift Chart, Lift • Cumulative Gain, Gain • ROC, ROCplot • Sensitivity VS Specificity
...	Further arguments to or from other methods.

Details

The input X can contain both numerical and categorical variables.

All the input variables are converted according to the results of Weight of Evidence calculation ([WeightEvid](#)). Numerical variables are factorised according with the number of segments indicated by the parameter "nseg".

Value

The function returns an object of class "scorecard" containing:

Scorecard	: data frame containing the score card results ("Variable", "Segment", "WoE", "Est.Coeff", "Wald-Z", "P-Val", "Ods_ratio", "Score", "Round.Score");
-----------	---

`Model` : an object of class "glm" - "lm" with the results of logistic model (see [glm](#));
`WeightOfEvidence` : A matrix containing the results of Weight of Evidence calculation (see [WeightEvid](#));

Author(s)

RAdamant Development Team <team@r-adamant.org>

# load example data set
data(ex_credit)

## Generate Score Card
data = ex_credit[, -1]
target = ex_credit[, 1]

# Two segments for numerical variables
sc2 = Score.card(X=data, Y=target, nseg = c(2,4))
sc2
# Three segments for numerical variables
sc3 = Score.card(X=data, Y=target, nseg = c(2,3,4))
sc3

# display more detailed results with the method summary
summary(sc2)
summary(sc3)

# ... show plots
# display more detailed results with the method summary
summary(sc2, plot=TRUE)
summary(sc3, plot=TRUE)
```

sensen

Sensitivity analysis default method

Description

Sensitivity analysis default method

Usage

```
sensAnalysis(X, ...)  
## Default S3 method:  
sensAnalysis(X, win.size = length(coef(X)), plot = FALSE, ...)
```

Arguments

<code>X</code>	<code>X</code>
<code>win.size</code>	<code>win.size</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods

Note

TO BE COMPLETED

`sensenlm`*Sensitivity analysis method for lm*

Description

Sensitivity analysis method for lm

Usage

```
## S3 method for class 'lm'  
sensAnalysis(X, ...)
```

Arguments

<code>X</code>	OBJECT of class "lm".
<code>...</code>	Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

sensanrg

*Sensitivity analysis method for reg***Description**

Sensitivity analysis method for reg

Usage

```
## S3 method for class 'reg'
sensAnalysis(X, ...)
```

Arguments

X OBJECT of class "reg".
 ... Further arguments to or from other methods

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

sharpe

*Sharpe index***Description**

Sharpe: Calculate Sharpe index for a portfolio.
 Sharpe.Capm: Get Sharpe index from an object of class. "Capm"

Usage

```
Sharpe(PTF, ...)
## Default S3 method:
Sharpe(PTF, rfr = 0, ...)
## S3 method for class 'Capm'
Sharpe(PTF, rfr = 0, ...)
```

Arguments

PTF Input portfolio or an object of class "Capm"
 rfr risk free rate
 ... Further arguments to or from other methods

sinma	<i>(Normalised) Sine Weighted Moving Averages</i>
-------	---

Description

Compute multiple (Normalised) Sine Weighted Moving Averages on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
sinma(X, win.size = 10, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = 10).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Further arguments to or from other methods

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
Weights: $\sin(\pi * (1:\text{win.size})/(\text{win.size}+1))$

Value

A object of class 'ma' with attributes `type = "SINMA"` and `'win.size'` as from the corresponding input parameter:
- matrix of size $\text{NROW}(X)$ by $\text{NCOL}(X) * \text{length}(\text{win.size})$ where each column is the moving average of length $\text{win.size}[i]$ of the corresponding column of X .

Author(s)

# single lag
sinma(ex_fs, 30, plot=TRUE)
# multiple lags
sinma(ex_fs, seq(5,50,10), plot=TRUE)

## End(Not run)
```

sma

Simple Moving Average

Description

Compute multiple Simple Moving Averages on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$

Usage

```
sma(X, win.size = 10, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data <code>X</code> . (DEFAULT = 10).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by the function <code>Mmovav</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'ma' with attributes type = "SMA" and 'win.size' as given by the corresponding input parameter:

- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

```

Arguments

X	X
plot	plot
...	...

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

specgram

Spectrogram using short-time Fourier transform

Description

Computes FFT on each column of X. For Financial series objects (class 'fs'), Close data is extracted.

Usage

```
specgram(X, win.size = max(1, NROW(X)/20), plot = TRUE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	The size of the window used to compute the FFT
plot	LOGICAL. If TRUE, spectrogram is plotted.
...	Additional parameters passed to splitWindow, FFT and plot.specgram

Details

A spectrogram is a time-varying spectral representation (forming an image) that shows how the spectral density of a signal varies with time. The most common format is a graph with two geometric dimensions: the horizontal axis represents time, the vertical axis is frequency; a third dimension indicating the amplitude of a particular frequency at a particular time is represented by the intensity or colour of each point in the image. A forward sliding window of length win.size is used to split the input data into segments, then for each segment the FFT of size $NFFT = 2^{\text{ceiling}(\log_2(\text{win.size}))}$ is computed. The sliding of the window is controlled by the 'by' parameter of the splitWindow function (default: by = 1). The 'by' parameter should take values between 1 and win.size. If by = win.size, the input data is split into $N\text{windows} = \text{ceiling}(N\text{RowX}/\text{win.size})$ non-overlapping adjacent blocks. If by = 1 then $N\text{windows} = N\text{RowX} - \text{win.size} + 1$ overlapping segments are computed.

Value

An object of the class 'specgram'. This is an array with dimensions (NFFT, Nwindows, NColX):

NFFT	The FFT length. It is the next power of 2 greater than the length of each segment/window of X.
Nwindows	The number of window segments computed. It depends on the 'by' parameter (default is 1) of the <code>splitWindow</code> function (see details).
NColX	The number of columns of X.

The following attributes are attached to the object:

Fs	The input Fs parameter to the FFT.
window	The window function used to smooth the input data.
freq	The frequencies where the FFT was evaluated.
fpoints	The array indices where the frequency points relative to 'freq' are stored.
half	The input half parameter to the FFT.

Author(s)

RAdamant Development Team <team@r-adamant.org>

# Sampling period
Ts = 0.01
# Generate 10 seconds timeline
t = seq(0, 10, by = Ts)
# Sampling frequency
Fs = 1/Ts
# Linear increasing frequency
f = 2*t
#Chirp signal - Cosine of increasing frequency
chirp = as.matrix(cos(2*pi*f*t))
colnames(chirp) = "Chirp"

# 2D spectrogram
specgram(chirp, Fs = Fs)
# 2D spectrogram with non overlapping windows
specgram(chirp, Fs = Fs, win.size = 128, by = 128)
# 3D spectrogram
specgram(chirp, Fs = Fs, win.size = 128, plot3d = TRUE)
```

splitwdw

Sliding windows

Description

Sliding windows

Usage

```
splitWindow(N, direction = c("forward", "backward"),
mode = c("EW", "SW"), from = NULL,
win.size = 1, by = 1, labels = 1:N, ...)
```

Arguments

N	N
direction	direction
mode	mode
from	from
win.size	win.size
by	by
labels	labels
...	...

sssym

State Space system simulation

Description

Generic function for State Space system simulation. The system can be either linear or non linear.

Usage

```
ss.sym(X, F = NULL, G = NULL, H = NULL, D = NULL,
init = 0, SLen = ifelse(is.function(F), NA,
NROW(F)), YLen = ifelse(is.function(H), NA, NROW(H)), ...)
```

Arguments

X	Matrix of data series (one column per variable).
F	[State -> State] transition matrix or [(State, Input) -> State] function (F = function(S, X, n, ...) returning the new state vector S_new based on the current State S and the data X at time period n) (DEFAULT = NULL)
G	[Input -> State] transition matrix. Only for linear models (DEFAULT = NULL)
H	[State -> Output] transition matrix or [(State, Input) -> Output] function (H = function(S, X, n, ...) returning the new output vector Y[, n] based on the new state S[, n] and the data X at time period n) (DEFAULT = NULL -> converted in diag(SLen))
D	[Input -> Output] transition matrix. Only for linear models (DEFAULT = NULL -> converted to a zero matrix SLen by NCOL(X))
init	Initial values for the state vector S (DEFAULT = 0, recycled to length SLen if necessary)
SLen	Length of the state vector S. (DEFAULT = ifelse(is.function(F), NA, NROW(F)))
YLen	Number of columns of the output vector Y. (DEFAULT = ifelse(is.function(H), NA, NROW(H)))
...	Additional parameters accepted by the functions F and H

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'ss' with attributes 'F', 'G', 'H', 'D' as given by the corresponding input parameters:

- matrix of size NROW(X) by YLen, result of the simulation of the given dynamic system subject to input 'X' and initial condition 'init'.

RAdamant Development Team <team@r-adamant.org>

stacklev

Retrieve the number of calls in the stack.

Description

Retrieve the number of calls in the stack. To be called from inside a function.

Usage

```
CallStackLevels()
```

Value

The number of calls in the stack.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Create two nested functions
f1 = function() {
  f2();
}
f2 = function() {
  CallStackLevels()
}

# Returns 1
f2();
# Returns 2
f1();
```

starc

Stoller Starc bands

Description

Compute Stoller Starc bands (Technical Analysis)

Usage

```
starc(Close, High = NULL, Low = NULL, atr.mult = 2, lag = 5, atr.lag =
14, mov = c("sma", "ema", "wma"), plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
atr.mult	atr.mult
lag	INTEGER. Number of lag periods.
atr.lag	atr.lag
mov	mov
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

styles	<i>Styles analysis (portfolio)</i>
--------	------------------------------------

Description

Perform Style analysis for single and multiple time periods

Usage

```
Styles(FUND, IND, W, lower = NULL, upper = NULL, ...)

Multi.Styles(FUND, IND, W, n_clust = 5, lower = NULL, upper = NULL, ...)
```

Arguments

FUND	Vector. Benchmark investment fund
IND	Matrix of indices (returns)
W	Initial weghts to be assigned to the indices
n_clust	Number of time periods clusters for multi period analysis
lower	Lower boundary for the optimal weights (used in optim)
upper	Upper boundary for the optimal weights (used in optim)
...	Further arguments to or from other methods.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load examples portfolio
data(ex_ptf)
# set initial weights
ww = c(0.09, rep(0.13,6))
# single period style analysis
Styles(FUND=ex_ptf[,1], IND=ex_ptf[, -1] , W=ww, lower=NULL, upper=NULL)
# multi period style analysis
Multi.Styles(FUND=ex_ptf[,1], IND=ex_ptf[, -1] , n_clust=5, W=ww, lower=NULL, upper=NULL)
```

sumdd	<i>Summary drawdown</i>

Description

Summary function for drawdown

Usage

```
SummaryDD (DD)
```

Arguments

DD	OBJECT of class "drawdown"
----	----------------------------

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

sumdens

Plot summary information

Description

Plot summary information of a vector with its density

Usage

```
Sum.dens(x, ...)
```

Arguments

`x` VECTOR. Input series.
`...` further arguments for "plot" function

Author(s)

RAdamant Development Team <team@r-adamant.org>

sumreg

Summary method for mreg

Description

Summary method for mreg

Usage

```
## S3 method for class 'mreg'
summary(object, ...)
```

Arguments

`object` OBJECT of class "mreg"
`...` Further arguments to or from other methods

`swing`*Swing Index*

Description

Calculate Swing index (Technical Analysis)

Usage

```
Swing(Close, High, Low, Open, ret_cum = FALSE, plot = FALSE, ...)
```

Arguments

<code>Close</code>	VECTOR. Close price.
<code>High</code>	VECTOR. High price.
<code>Low</code>	VECTOR. Low price.
<code>Open</code>	VECTOR. Open price.
<code>ret_cum</code>	<code>ret_cum</code>
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

`symlookup`*Lookup Stock Symbol from Yahoo!*

Description

Lookup stock symbols for which the symbol, name or description matches the input string value.

Usage

```
symbol.lookup(what = "")
```

Arguments

<code>what</code>	The string to search for.
-------------------	---------------------------

Value

A matrix containing the top 10 stock symbols that match the input, with the following columns:

Symbol	The stock symbol.
Name	The stock name.
Exchange	The Exchange symbol.
Type	The Exchange Name.

Author(s)

RAdamant Development Team <team@r-adamant.org>

See Also

[get.fs](#)

Examples

```
# lookup the symbol for Apple
symbol.lookup("Apple")
# Apple
APPLE = get.fs("AAPL", from=as.Date("2008-06-01"), to=as.Date("2011-04-01"));
```

tema

Triple EMA

Description

Compute multiple Triple EMA on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
tema(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
plot	LOGICAL. Return plot.
\dots	Additional parameters accepted by function <code>ema</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

TEMA is a weighted combination of EMA: $3 * \text{EMA}(X) - 3 * \text{EMA}(\text{EMA}(X)) + \text{EMA}(\text{EMA}(\text{EMA}(X)))$.

Smoothing factor: $\lambda = 2 / (\text{win.size} + 1)$.

Value

A object of class 'ma' with attributes type = "TEMA" and 'win.size' as given by the corresponding input parameter:

- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
tema(x, 10)

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
tema(x, 40, plot = TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
tema(ex_fs, 15, plot=TRUE)

## End(Not run)
```

thigh

True High oscillator

Description

Compute True High oscillator (Technical Analysis)

Usage

```
thigh(Close, High = NULL, lag = 5, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

tirlev

Trione levels

Description

Compute Trione levels (Technical Analysis)

Usage

```
tirLev(High, Low, Close, lag = 5, plot = FALSE, ...)
```

Arguments

High	VECTOR. High price.
Low	VECTOR. Low price.
Close	VECTOR. Close price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

RAdamant Development Team <team@r-adamant.org>

tlow	<i>True Low oscillator</i>
------	----------------------------

Description

Compute True Low oscillator (Technical Analysis)

Usage

```
tlow(Close, Low = NULL, lag = 5, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

tma	<i>Triangular Moving Averages</i>
-----	-----------------------------------

Description

Compute multiple Triangular Moving Averages on the input data, one for each column of X[, i] and window size win.size[j]

Usage

```
tma(X, win.size = 10, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = 10).
plot	LOGICAL. Return plot.
...	Additional parameters accepted by the function Mmovav.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'ma' with attributes type = "TMA" and 'win.size' as given by the corresponding input parameter:

- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

tma(ex_fs, 30, plot=TRUE)
# multiple lags
tma(ex_fs, seq(5,50,10), plot=TRUE)

## End (Not run)
```

treynor

Treynor index

Description

Treynor: Calculate Treynor index for a portfolio

Treynor.Capm: Get Treynor index from an object of class "Capm"

Usage

```
Treynor(PTF, ...)
## Default S3 method:
Treynor(PTF, PTF_M, rfr = 0, rf = NULL, ...)
## S3 method for class 'Capm'
Treynor(PTF, rfr = 0, ...)
```

Arguments

PTF	Input portfolio or an object of class "Capm"
PTF_M	Market/benchmark portfolio
rfr	risk free rate
rf	risk free asset
...	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

trf

(Average) True range

Description

Compute (Average) True range (Technical Analysis)

Usage

```
trf(Close, High = NULL, Low = NULL, lag = 1,
     average = TRUE, avg.lag = 14, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
average	average
avg.lag	avg.lag
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

triangle	<i>Triangle window</i>
----------	------------------------

Description

Computes Triangle window of given length

Usage

```
triangle(N, normalized = TRUE)
```

Arguments

N	Window length.
normalized	LOGICAL. If TRUE (default), window is normalised to have unitary norm.

Value

An object of the class 'Window'. It is a simple sequence of N samples of the Triangle window.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# Generate a Normalised Triangle window of size 100
x = triangle(100)
# Plot the window
cplot(x
, main = "Triangle Window"
, legend = attr(x, "type")
)
# Generate a non-normalised window
y = triangle(100, FALSE)
# Compare the two
cplot(cbind(x, y)
, main = "Triangle Window"
, legend = paste(attr(x, "type"), c("Normalised", "Not Normalised"))
, type = c("l", "o")
, xlab.srt = 0
)
```

ttma

T3 EMA

Description

Compute multiple T3 EMA on the input data, one for each column of $X[, i]$ and window size $\text{win.size}[j]$.

Usage

```
ttma(X, win.size = NROW(X), alpha = 0.7, plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data X . (DEFAULT = $\text{NROW}(X)$).
<code>alpha</code>	weight in the interval $[0, 1]$. (DEFAULT: 0.7).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by function <code>ema</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

T3 EMA is a three times application of GDEMA: $\text{GDEMA}(\text{GDEMA}(\text{GDEMA}(X, \text{alpha}), \text{alpha}), \text{alpha})$.

Smoothing factor: $\text{lambda} = 2/(\text{win.size}+1)$.

Value

A object of class 'ma' with attributes `type = "TTMA"` and `'win.size'` as given by the corresponding input parameter:

- matrix of size `NROW(X)` by `NCOL(X)*length(win.size)` where each column is the moving average of length `win.size[i]` of the corresponding column of `X`.

data(ex_fs)
# single lag
ttma(ex_fs, 15, plot=TRUE)

## End(Not run)
```

typ

Typical price

Description

Compute Typical price (Technical Analysis)

Usage

```
typ(Close, High, Low, plot = FALSE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

ulcer

Ulcer index

Description

Compute Ulcer index (Technical Analysis)

Usage

```
ulcer(X, lag, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

ultima	<i>Ultima oscillator</i>
--------	--------------------------

Description

Compute Ultima oscillator (Technical Analysis)

Usage

```
ultima(Close, High = NULL, Low = NULL, lag = 1, win1 = 7, win2 = 14, win3 = 28,
...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
win1	win1
win2	win2
win3	win3
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

univar	<i>Univariate analysis</i>
--------	----------------------------

Description

Perform univariate analysis of the dependent variable Y versus each independent variable X, plotting the results

Usage

```
univar(Y, X, stress.period.idx = c(),
Y.logit = FALSE, Y.logit.adj = 5e-05,
theme.params = getCurrentTheme(),
plot = TRUE, overrides = list(...), ...)
```

Arguments

<code>Y</code>	serie of the dependent variable
<code>X</code>	Matrix containing all independent variables (one column per variable)
<code>stress.period.idx</code>	vector of positions specifying the stress regime. If provided, the system will run a modified LS to capture the two regimes
<code>Y.logit</code>	LOGICAL. If TRUE, the dependent variable is transformed using the Logit transform. The results are retransformed using the inverse Logit. (DEFAULT: FALSE)
<code>Y.logit.adj</code>	Cut-off value. The range of the Y variable is restricted within the interval [Y.logit.adj, 1-Y.logit.adj] (DEFAULT: 0.00005)
<code>theme.params</code>	Theme parameters (DEFAULT: <code>getCurrentTheme()</code>)
<code>plot</code>	list of parameters to override the theme. Must match by name the parameters defined by the theme (DEFAULT: NULL)
<code>overrides</code>	LOGICAL. If TRUE, results are plotted.
<code>...</code>	Further arguments to or from other methods

Author(s)

RAdamant Development Team <team@r-adamant.org>

<code>var</code>	<i>Value at Risk</i>
------------------	----------------------

Description

General VaR, computed on each column of the input matrix

Usage

```
VaR(X, ...)
## Default S3 method:
VaR(X, p = 0.05, probf = c("norm", "t", "cofi"),
    df = max(4, (kurt(X)+3)), params = FALSE, ...)
```

Arguments

<code>X</code>	Input matrix/sequence. Sequences are treated as one column matrices.
<code>p</code>	Vector of probabilities (DEFAULT = 0.05)
<code>probf</code>	Probability distribution, see Details
<code>df</code>	Degrees of freedom for the Student T distribution (DEFAULT = $\max(4, (\text{kurt}(X)+3))$)
<code>params</code>	Additional parameter for future development
<code>...</code>	Additional parameters accepted by the function <code>cofit</code>

Details

Accepted probability distributions:

- "norm" = Normal distribution
- "t" = Students T distribution
- "cofi" = Cornish-Fischer distribution

Value

General VaR, computed on each column of the input matrix

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

varptf	<i>Portfolio Value at Risk</i>
--------	--------------------------------

Description

General VaR, computed for an input portfolio

Usage

```
VarPtF(X, p = 0.05, weights = rep(1/NCOL(X), NCOL(X)), probf = c("norm", "t"), df
```

Arguments

X	Input matrix/sequence. Sequences are treated as one column matrices.
p	vector of probabilities (DEFAULT = 0.05)
probf	probability distribution, see Details
weights	portfolio weights (DEFAULT = rep(1/NCOL(X), NCOL(X)))
df	Degrees of freedom for the Student T distribution (DEFAULT = 4)
...	Additional parameters for future development

Details

Accepted probability distributions:

- "norm" = Normal distribution
- "t" = Students T distribution
- "cofi" = Cornish-Fischer distribution

Value

A matrix length(p) by 1 of computed portfolio VaRs

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

vcmo

Variable Chande Momentum Oscillator

Description

Compute Variable Chande Momentum Oscillator (Technical Analysis)

Usage

```
vcmo(X, lag = 5, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

vecar

Vector Autoregressive model

Description

Estimate Vector Autoregressive model

Usage

```
VecAr(X, ...)

## Default S3 method:
VecAr(X, ar.lags = 1:2,
type = c("const", "trend", "constrend", "none"),
exog = NULL, ...)
```

Arguments

<code>x</code>	Input matrix of time series. N.B. The first column is taken as dependent variable
<code>ar.lags</code>	Number (or vector) of lags for the AR components
<code>type</code>	Type of deterministic regressor(s) to be included in the model
<code>exog</code>	matrix of exogenous variables (Default = NULL)
<code>...</code>	Further arguments to or from other methods

Value

An object list of class "VecAr". The list contains the following elements:

- Results of the estimation ("lm" object)
- Nunmber of Observations
- Number of Variables
- Number of Parameters
- LogLikelihood value
- AIC information criteria
- BIC information criteria

Author(s)

RAdamant Development Team <team@r-adamant.org>

[Strvar.VecAr](#), [fitted.VecAr](#)

vhff

Vertical Horizontal Filter

Description

Compute Vertical Horizontal Filter (Technical Analysis)

Usage

```
vhff(X, lag = 9, plot = FALSE, ...)
```

Arguments

<code>x</code>	<code>X</code>
<code>lag</code>	INTEGER. Number of lag periods.
<code>plot</code>	LOGICAL. If TRUE plot is returned.
<code>...</code>	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

vidyaf	<i>Variable Index Dynamic Average</i>
--------	---------------------------------------

Description

Compute Variable Index Dynamic Average (Technical Analysis)

Usage

```
vidyaf(X, lag = 5, plot = FALSE, ...)
```

Arguments

X	X
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

vwma	<i>Volume Weighted Moving Averages</i>
------	--

Description

Compute multiple Volume Weighted Moving Averages on the input data, one for each column of X[, i] and window size win.size[j].

Usage

```
vwma(X, Vol = NULL, win.size = 10, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
Vol	Matrix of volumes (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = 10).
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

If X is a financial time series (class = 'fs'), and Vol = NULL then Vol = X[, 'Volume'] (DEFAULT = NULL).

Value

A object of class 'ma' with attributes type = "VWMA" and 'win.size' as from the corresponding input parameter:

- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

## End(Not run)
```

wad	<i>Williams Advance Decline</i>
-----	---------------------------------

Description

Compute Williams Advance Decline (Technical Analysis)

Usage

```
wad(Close, High = NULL, Low = NULL, lag = 5, na.rm = FALSE, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
na.rm	na.rm
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

weigevid	<i>Weight of Evidence</i>
----------	---------------------------

Description

Calculate weight of evidence for a matrix with target variable

Usage

```
WeightEvid(data, target, nseg, missing = FALSE, na.replace=NULL, ...)
```

Arguments

data	MATRIX or DATA.FRAME. Input data.
target	Vector. Target variable in binary format 0-1
nseg	Integer or Vector. Number of segment to split the numerical variables.
missing	Logical. If TRUE missing values are considered in the calculation as a separate class.
na.replace	CHARACTER / NUMERIC. Value to replace missing. If NULL missing values are not considered in the computation.
...	Further parameter for the function Factorise

Value

A matrix containing the following columns:

- "Variable"
- "Segment"
- "Obs"
- "PC.Obs"
- "Good"
- "PC.Good"
- "Bad"
- "Pc.Bad"
- "Rate"
- "Weight.Evidence"
- "Info.Value.Within"
- "Info.Value"

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
# load example data set "credit"
data(ex_credit)
# calculate weight of evidence
input = ex_credit[, -1]
target = ex_credit[, 1]
woe = WeightEvid(data=input, target=target, nseg = 2:3, missing=FALSE)
# quick look of the results got from WeightEvid
woe
```

whvar	<i>Weighted Historical Value at Risk</i>
-------	--

Description

Compute Weighted historical VaR on each column of the input matrix

Usage

```
whVaR(X, p = 0.05, lambda = 0.9, centered = FALSE)
```

Arguments

X	Input matrix/sequence. Sequences are treated as one column matrices.
p	vector of probabilities (DEFAULT = 0.05)
lambda	controls the exponential window $\lambda^{(NROW(X)-1):0}$ (DEFAULT = 0.9)
centered	LOGICAL. If TRUE, input data are standardised

Value

A matrix $\text{length}(p)$ by $\text{NCOL}(X)$ of computed quantiles

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

wildavg	<i>Wilder Moving Average</i>
---------	------------------------------

Description

Compute Wilder Moving Average (Technical Analysis)

Usage

```
wildAvg(X, lag = 5, plot = FALSE, ...)
```

Arguments

X	X
lag	lag
plot	plot
...	...

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

wildsum

Wilder Summation

Description

Compute Wilder Summation (Technical Analysis)

Usage

```
wildSum(x, lag = 5)
```

Arguments

x	x
lag	lag

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

wma

Weighted Moving Averages

Description

Compute multiple Weighted Moving Averages on the input data, one for each column of X[, i] and window size win.size[j]

Usage

```
wma(X, win.size = 10, plot = FALSE, ...)
```

Arguments

X	Matrix of data series (one column per variable).
win.size	vector of moving average window sizes (lags) to be applied on the data X. (DEFAULT = 10).
plot	LOGICAL. Return plot.
...	Additional parameters accepted by the function Mmovav.

Details

For financial time series (class = 'fs'), only 'Close' column is processed.

Value

A object of class 'ma' with attributes type = "WMA" and 'win.size' as given by the corresponding input parameter:

- matrix of size NROW(X) by NCOL(X)*length(win.size) where each column is the moving average of length win.size[i] of the corresponding column of X.

Author(s)

RAdamant Development Team <team@r-adamant.org>

Examples

```
## load a dataset provided by R
data(EuStockMarkets)
# extract sample (log) time series
x = log(EuStockMarkets[500:800,2, drop=FALSE])
# compute moving average with single lag
wma(x, 10)
# compute moving average with multiple lags
wma(x, c(10,20))

## Not run:
# refine results of moving average
setCurrentTheme(1)
# single lag
wma(x, 30, plot = TRUE)
# multiple lags
wma(x, seq(5,50,10), plot=TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(2)
data(ex_fs)
# single lag
wma(ex_fs, 30, plot=TRUE)
# multiple lags
wma(ex_fs, seq(5,50,10), plot=TRUE)

## End(Not run)
```

wro

Williams R

Description

Compute Williams R (Technical Analysis)

Usage

```
wro(Close, High = NULL, Low = NULL, lag = 5, plot = TRUE, ...)
```

Arguments

Close	VECTOR. Close price.
High	VECTOR. High price.
Low	VECTOR. Low price.
lag	INTEGER. Number of lag periods.
plot	LOGICAL. If TRUE plot is returned.
...	Further arguments to or from other methods.

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

zind

Z index

Description

Compute the Z-score of X (Standardize each column of X)

Usage

```
zind(x, sigma = 1, mi = 2)
```

Arguments

x	x
sigma	sigma
mi	mi

Note

TO BE COMPLETED

Author(s)

RAdamant Development Team <team@r-adamant.org>

zlma	<i>Zero lag Moving Average</i>
------	--------------------------------

Description

Compute multiple Zero-Lag Exponential Moving Averages on the input data, one for each column of `X[, i]` and window size `win.size[j]`.

Usage

```
zlma(X, win.size = NROW(X), plot = FALSE, ...)
```

Arguments

<code>X</code>	Matrix of data series (one column per variable).
<code>win.size</code>	vector of moving average window sizes (lags) to be applied on the data <code>X</code> . (DEFAULT = <code>NROW(X)</code>).
<code>plot</code>	LOGICAL. Return plot.
<code>...</code>	Additional parameters accepted by function <code>ema</code> .

Details

For financial time series (class = 'fs'), only 'Close' column is processed.
ZLMA is a combination of EMA: $\text{EMA}(X) + \text{EMA}(X - \text{EMA}(X))$.

Value

A object of class 'ma' with attributes `type = "EMAT"` and `lambda = 2/(win.size+1)`:
- matrix of size `NROW(X)` by `NCOL(X)*length(win.size)` where each column is the moving average of length `win.size[i]` of the corresponding column of `X`.

Author(s)

RAdamant Development Team <team@r-adamant.org>

```
# single lag
zlma(x, 15, plot = TRUE)

# calculate moving average for an object of class "fs"
setCurrentTheme(1)
data(ex_fs)
# single lag
zlma(ex_fs, 30, plot=TRUE)

## End(Not run)
```

zscore

Z Score

Description

Compute the Z-score of X (Standardize each column of X)

Usage

```
Zscore(X, means = NULL, sigma = NULL)
```

Arguments

X	Matrix of data series (one column per variable)
means	Mean value
sigma	Standard deviation

Value

Matrix of standardised variables

Author(s)

RAdamant Development Team <team@r-adamant.org>
